

# Supplementary Materials: High Uric Acid Ameliorates Indoxyl Sulfate-Induced Endothelial Dysfunction and Is Associated with Lower Mortality among Hemodialysis Patients

Wei-Liang Hsu, Szu-Yuan Li, Jia-Sin Liu, Po-Hsun Huang, Shing-Jong Lin, Chih-Cheng Hsu, Yao-Ping Lin and Der-Cherng Tarn

**Figure S1.** Serum UA level in the study population of stable hemodialysis patients. The serum UA level was normally distributed in the study population, with a mean concentration of 7.1 mg/dL (A); Analysis of individual patient data indicated that the serum UA concentration changed over time, so the time-averaged UA was not tightly correlated with the first year UA concentration ( $r^2 = 0.75$ ) or the last year UA concentration ( $r^2 = 0.77$ ) (B,C).

**Table S1.** Impact of serum UA level on risk of death by different causes. Hazard ratios were calculated by intention to treat (ITT) and as-treated analysis.

Uric acid ( mg / dL ) Subgroups	Intention-To Treat (1st Year UA)		As-Treated Analysis (Last Year UA)
