Radiation and Stemness Phenotype May Influence Individual Breast Cancer Outcomes: The Crucial Role of MMPs and Microenvironment

María Auxiliadora Olivares-Urbano, Carmen Griñán-Lisón, Sandra Ríos-Arrabal, Francisco Artacho-Cordón, Ana Isabel Torralbo, Elena López-Ruiz, Juan Antonio Marchal and María Isabel Núñez

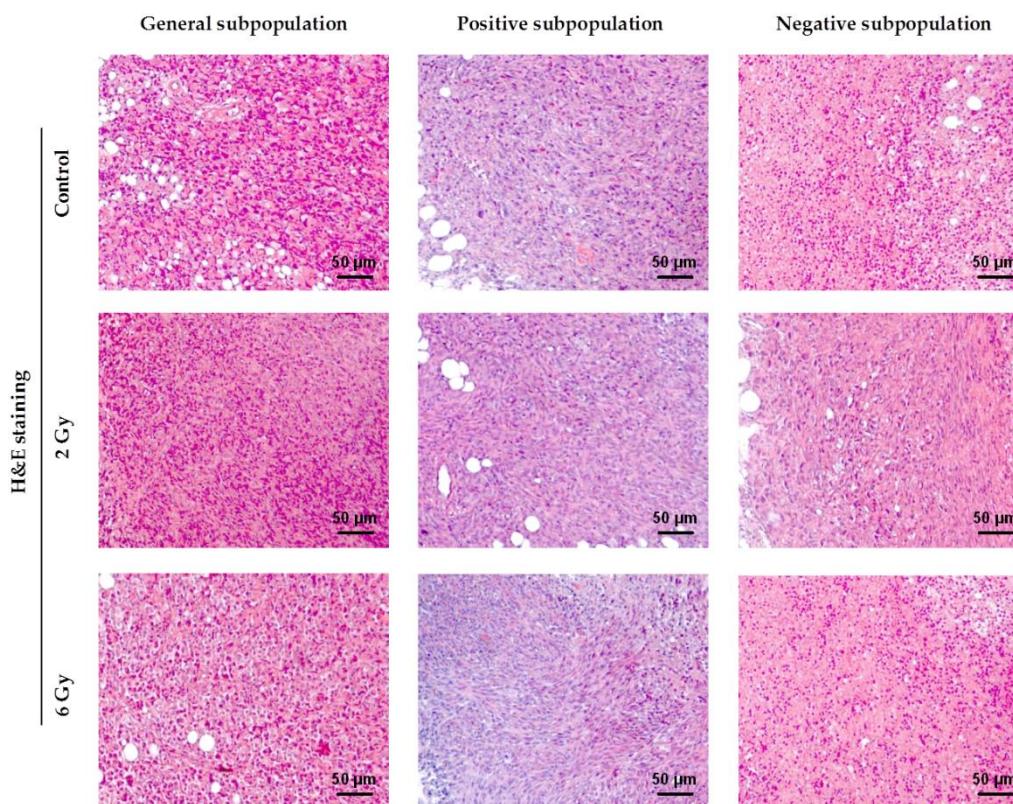

Figure S1. H&E staining of the tumors for all IR doses (0, 2 and 6 Gy) in the general, positive and negative cell subpopulations of the MDA-MB-231 cell line.

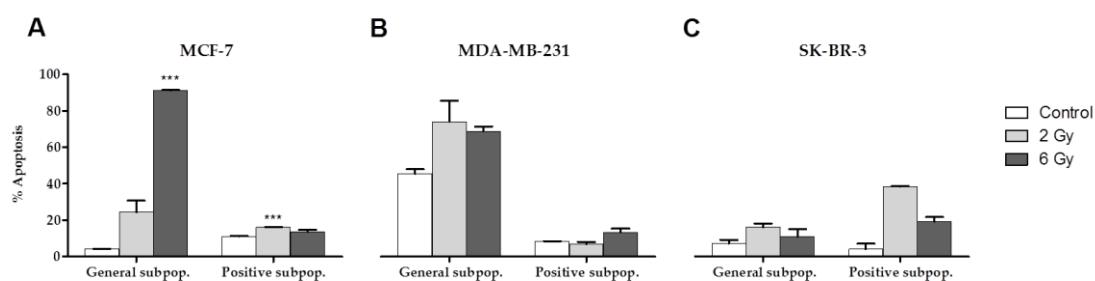

Figure S2. Values of apoptosis (%) at 0, 2 and 6 Gy IR doses measured 24 h after treatment in MCF-7 (A), MDA-MB-231 (B) and SK-BR-3 (C) cell lines in the general subpopulation and positive subpopulation cultures. Values are expressed as the mean ± SEM (error bars) of three independent experiments. Mean value for each experiment was calculated by averaging the triplicates ($n = 3$); *** $p < 0.001$.

Table S1. Expression values (fold change) of the genes detected in the 3D culture for all IR doses (0, 2 and 6 Gy) in the general, positive and negative cell subpopulations of the MCF-7, MDA-MB-231 and SK-BR-3 cell lines.

Genes	IR Dose	Expression Values (Fold Change)
