

Supplementary Appendix

This appendix has been provided by the authors to give readers additional information about their work.

Supplement to: van den Ende T, ter Veer E, Mali RMA, et al.

Index

Supplementary Methods

Supplementary Figure S1A,B: risk of bias overview

Supplementary Figure S2A,B: selection process for potentially clinically relevant prognostic and predictive factors

Supplementary Table S1 and S2: baseline characteristics of the included studies

Supplementary Table S3 and S4: multivariate hazard ratios for overall survival concerning prognostic factors

Supplementary Table S5 and S6: a full overview of predictive factors for overall survival

Single-centre studies were scored as unknown risk of bias on the item 'other biases'. The absence of a description of a blinded imaging review committee was not regarded as bias for OS, since the primary outcome OS would not be influenced by this parameter. += Low risk of bias; ?= unknown risk of bias.

Supplementary Figure S2. Selection of potentially clinically relevant prognostic and predictive factors

A

B

Supplementary Table S1. Baseline characteristics of the included studies for gastric cancer.

In total 39 studies reported data on prognostic and/or predictive factors for gastric cancer.[1-39] In total there were 16 secondary reports of original RCTs with data on prognostic and/or predictive factors.[40-55]

Studies	N	Regimen	Male N (%)	Age, median, (range), y	Stage

Supplementary Table S3. Multivariate hazard ratios concerning the curative treatment of gastric cancer for OS.

Reported HRs were extracted from the study reports. This overview is for exploratory purposes only as the majority of the studies did not report HRs. A random effect pairwise meta-analysis was performed in case there was more than one HR for the same two subgroups available. A HR > 1 indicates a worse survival for subgroup category 1 compared to category 2.

The HRs marked with a superscript number one were based on studies which treated patients neoadjuvant or the meta-analysis included both neoadjuvant and adjuvant studies. The other HRs are based on studies investigating adjuvant treatment.

Supplementary Table S4. Multivariate hazard ratios concerning the curative treatment of esophageal cancer for OS.

Reported HRs were extracted from the study reports. This overview is for exploratory purposes only as the majority of the studies did not report HRs. A random effect pairwise meta-analysis was performed in case there was more than one HR for the same two subgroups available. A HR > 1 indicates a worse survival for subgroup category 1 compared to category 2. The treatment strategies of the RCTs involved are outlined in the table. Subgroup analyses per factor for squamous cell carcinoma and adenocarcinoma were not performed due to the fact most studies included both subtypes.
