Weinstock and Giorgio Inghirami

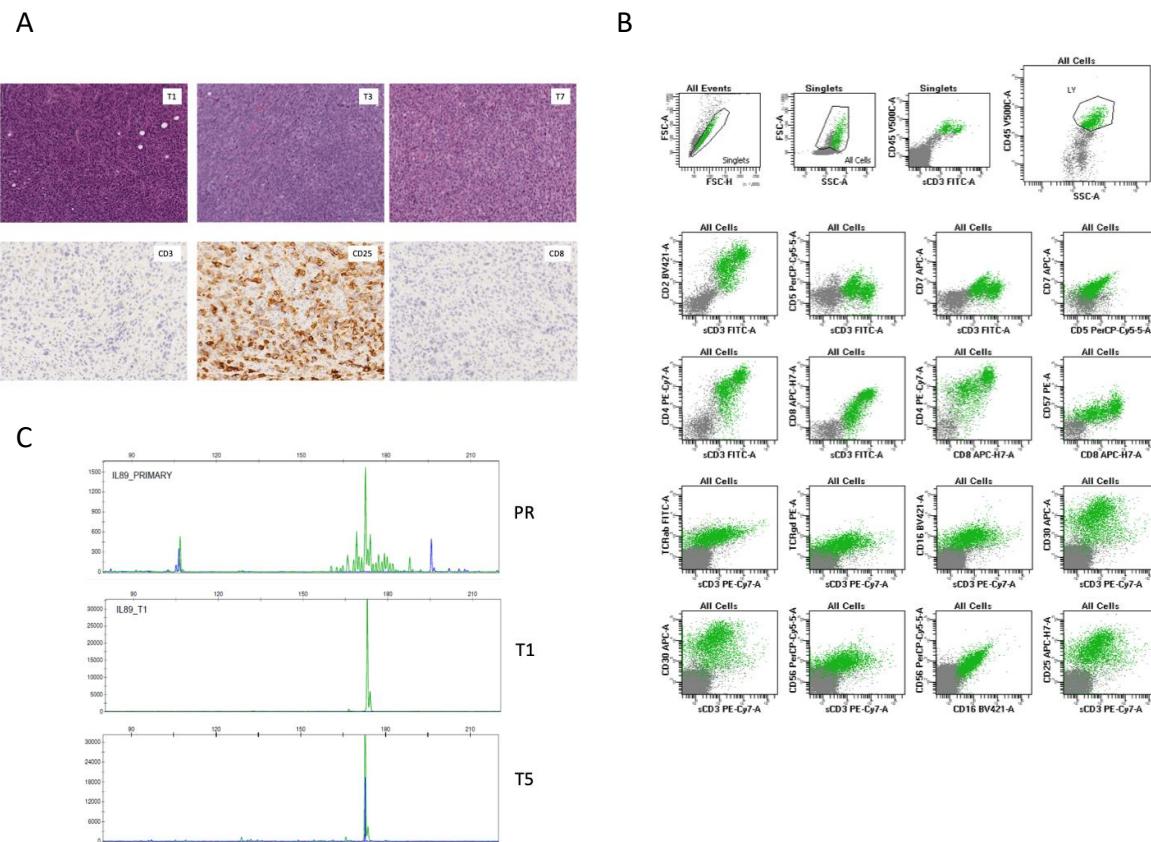

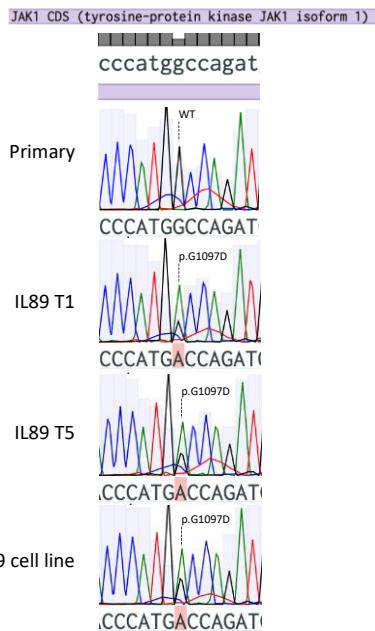

Figure S1. (A) Histology micrografts on IL89 PDTX show overall similarity between T1 T3 and T7 passages (upper panels). Immunohistochemical stains with the indicated antibodies (anti-CD3, anti-CD25 and anti-CD8 [x20]) (lower panels). (B) Flow cytometry panel comprehensive of the most represented surface T-cell lymphoma markers, including: CD2, CD3, CD4, CD5, CD8, CD16, CD25, CD30, CD56, TCRab, TCRgd. IL89 PDTX passage T3 is here depicted for illustration purposes. (C) Analysis of the TCR gamma specific rearrangement clonality in IL89 diagnostic sample and correspondent PDTX after 1 and 5 passages (T1 and T5).

B

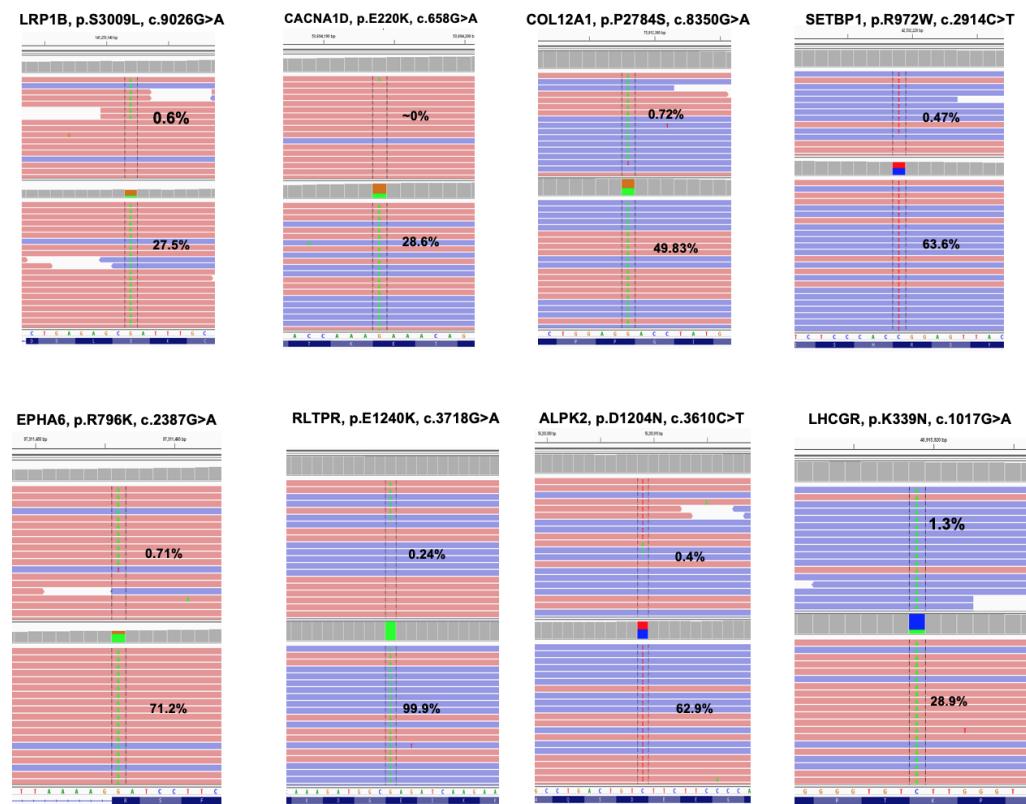

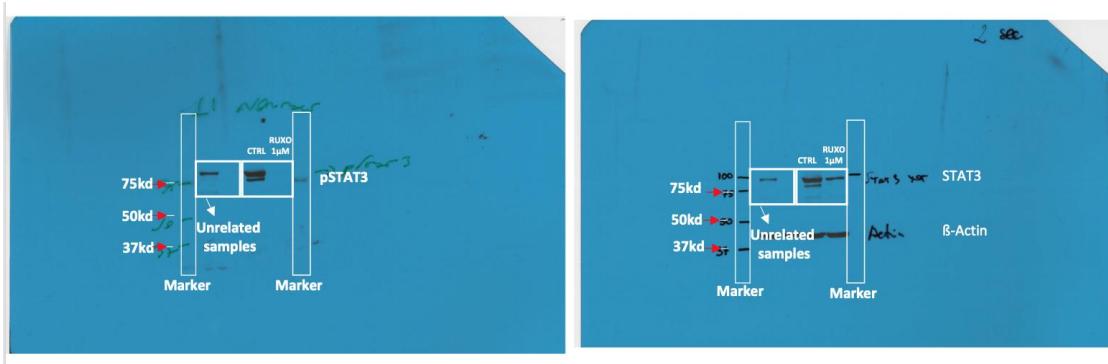

Figure S2. (A) Sanger sequencing confirms the presence of the JAK1 p.G1097D mutation in IL89 PDTX samples and in the cell line, but the mutation is undetectable in the primary due to the low sensitivity of the technique. (B) Manual backtracking of mutations in the primary tumor using deep sequencing data allowed for the identification of several hits at a very low VAF compared to the PDTX-T5.

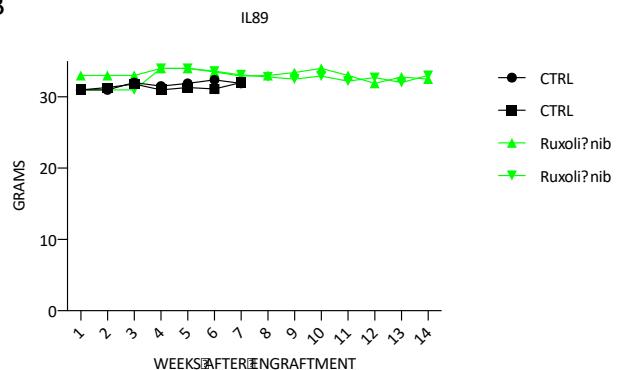

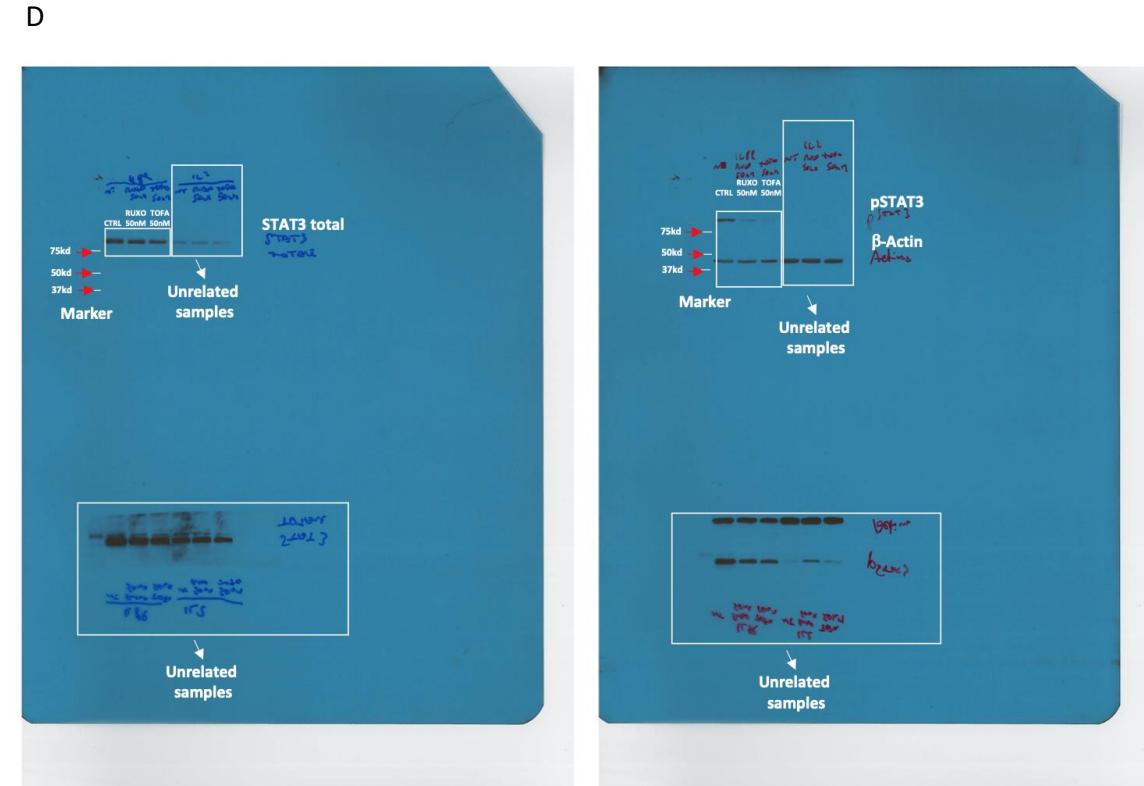

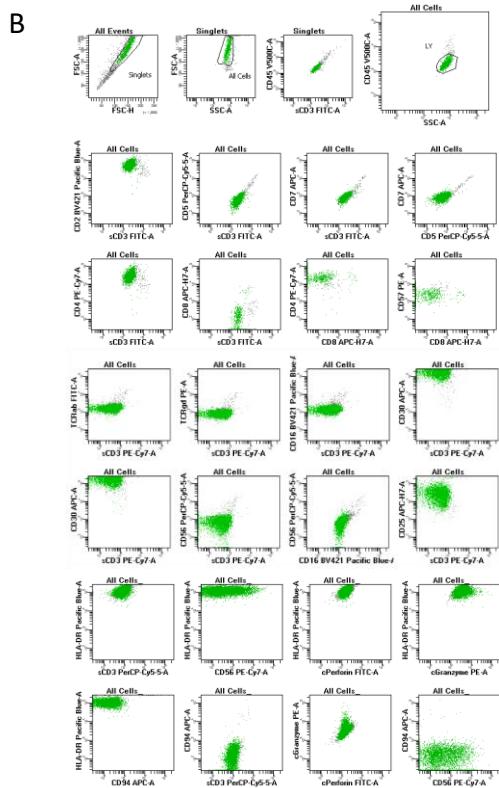

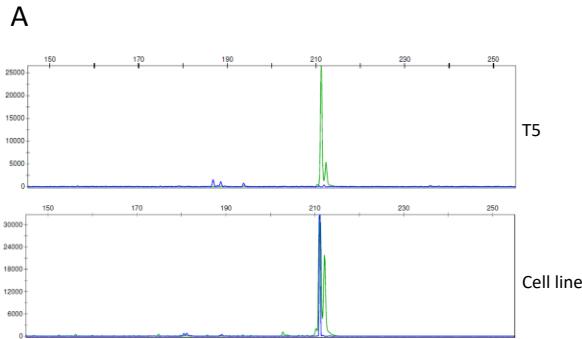

Figure S3. Additional data relative to Figure 4. (A) Uncropped film pictures relative to the WB in Figure 4A. (B) Weight of mice treated with ruxolitinib vs control. Mice who received ruxolitinib did not show any significant toxicity as demonstrated by the substantially constant weight along the treatment course.

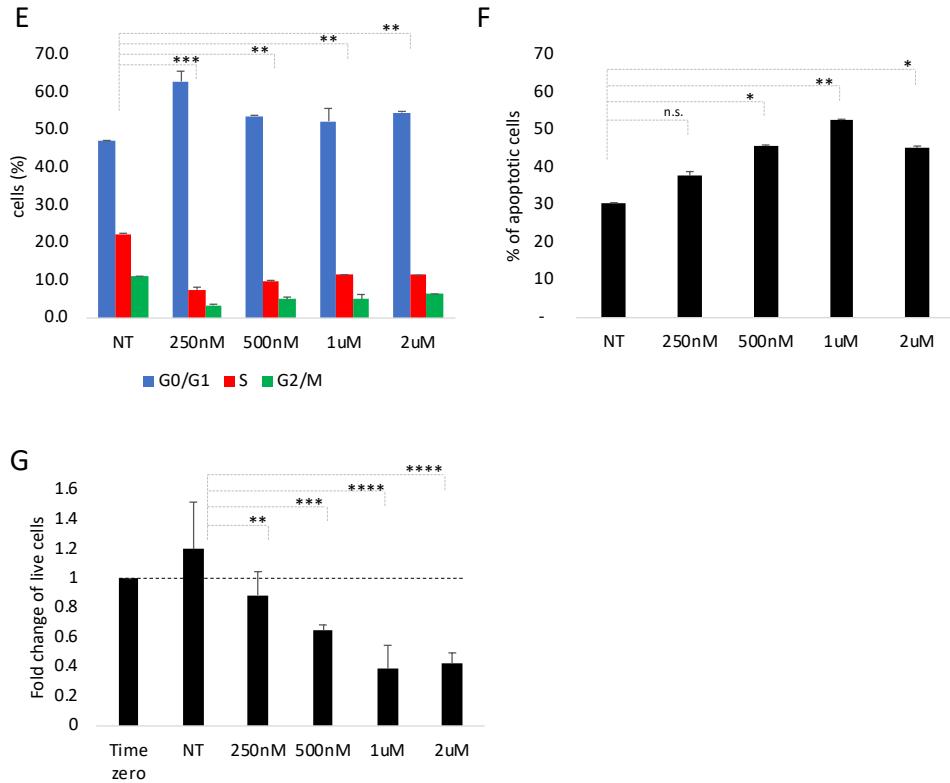

Figure S4. (A) Analysis of the TCR gamma specific rearrangement clonality in IL89 passage T5 and IL89_CL#3488. (B) Flow cytometry on IL89_CL#3488 with a panel comprehensive of the most represented surface T-cell lymphoma markers, including: CD2, CD3, CD4, CD5, CD8, CD16, CD25, CD30, CD56, TCRab, TCRgd. (C) Western Blot analysis in IL89_CL#3488 treated with 50nM of ruxolitinib or 50 nM tofacitinib for 24hr. (D) Uncropped film pictures relative to the WB in Figure Supplemental fig S4C. (E-F-G) Ruxolitinib treatment (different concentrations, 72hr) in IL89_CL#3488 resulted into a cell cycle arrest (E), an increase of the apoptotic rate (F), and a reduction of cell number (G) in vitro.

Table S4. Main oncogenic genes identified as mutated in IL89 BIA-ALCL.

Table S4: Main oncogenic genes identified as mutated in IL89 BIA-ALCL			
Gene	Function	Tumor	PMID
ALPK2	Protein kinase that recognizes phosphorylation sites in which the surrounding peptides have an alpha-helical conformation (PubMed:10021370).	Colorectal adenoma	22641666
COL12A1	This gene encodes the alpha chain of type XII collagen, a member of the FACIT (fibril-associated collagens with interrupted triple helices) collagen family. Type XII collagen is a homotrimer found in association with type I collagen, an association that is thought to modify the interactions between collagen I fibrils and the surrounding matrix	Gastric cancer	31432110
EPHA6	Eph receptors are the largest family of receptor tyrosine kinases (RTKs) and are divided into two subclasses, EphA	Prostate cancer	26041887

	and EphB. Originally identified as mediators of axon guidance, Eph receptors are implicated in many processes, particularly cancer development and progression.		
GPR110	Probable G-protein coupled receptor 110 is a protein that in humans is encoded by the GPR110 gene. This gene encodes a member of the adhesion-GPCR receptor family	Lung, Prostate cancer	20149256
IL22RA1	Component of the receptor for IL20, IL22 and IL24. Component of IL22 receptor formed by IL22RA1 and IL10RB enabling IL22 signaling via JAK/STAT pathways. IL22 also induces activation of MAPK1/MAPK3 and Akt kinases pathways. Component of one of the receptor for IL20 and IL24 formed by IL22RA1 and IL20RB also signaling through STATs activation. Mediates IL24 antiangiogenic activity as well as IL24 inhibitory effect on endothelial cell tube formation and differentiation.	Pancreatic cancer	29572224
KIAA0368	Adapter/scaffolding protein that binds to the 26S proteasome, motor proteins and other compartment specific proteins. May couple the proteasome to different compartments including endosome, endoplasmic reticulum and centrosome. May play a role in ERAD and other enhanced proteolysis (PubMed:15496406). Promotes proteasome dissociation under oxidative stress (By similarity)	Metastatic breast	29867227
LHCGR	Receptor for lutropin-choriogonadotrophic hormone (PubMed:11847099). The activity of this receptor is mediated by G proteins which activate adenylate cyclase (PubMed:11847099)	Ovarian cancer	26530886
LRP1B	LRP1B is a putative tumor suppressor and a member of the low-density lipoprotein (LDL) receptor family. The LDL receptor family have roles related to clearance of extracellular ligand and are proposed to be involved in extracellular signal transduction. silencing and down-expression of LRP1B has been observed in renal cell carcinoma and thyroid cancer. Further Deletion of LRP1B has been associated with chemotherapy resistance in high-grade serous cancers.	Melanoma, Non-small cell lung cancer (NSCLC), and others	31164891
MMP2	This gene is a member of the matrix metalloproteinase (MMP) gene family, that are zinc-dependent enzymes capable of cleaving components of the extracellular matrix and molecules involved in signal transduction. The protein encoded by this gene is a gelatinase A, type IV collagenase, that contains three fibronectin type II repeats in its catalytic site that allow binding of denatured type IV and V collagen and elastin. This protein is thought to be involved in multiple pathways including roles in the nervous system, endometrial menstrual breakdown, regulation of vascularization, and metastasis.	Breast cancer	29113219
PDGFB	This gene encodes a member of the protein family comprised of both platelet-derived growth factors (PDGF) and vascular endothelial growth factors (VEGF). The encoded preproprotein is proteolytically processed to generate platelet-derived growth factor subunit B, which can homodimerize, or alternatively, heterodimerize with the related platelet-derived growth factor subunit A. These proteins bind and activate PDGF receptor tyrosine kinases, which play a role in a wide range of developmental processes.	Melanoma, Lung, Glioblastoma, Bladder, Prostate, Colorectal and Ovarian cancers	26153649
PDGFRA	This gene encodes a cell surface tyrosine kinase receptor for members of the platelet-derived growth factor family. These	Gastrointestinal stromal cancer, Adenocarcinoma,	28572459

	<p>growth factors are mitogens for cells of mesenchymal origin. The identity of the growth factor bound to a receptor monomer determines whether the functional receptor is a homodimer or a heterodimer, composed of both platelet-derived growth factor receptor alpha and beta polypeptides.</p> <p>Studies suggest that this gene plays a role in organ development, wound healing, and tumor progression</p>	Glioblastoma multiforme, Colon adenocarcinoma, Melanoma	
PRMT3	This gene belongs to the protein arginine methyltransferase (PRMT) family. The encoded enzyme catalyzes the methylation of guanidino nitrogens of arginyl residues of proteins. The enzyme acts on 40S ribosomal protein S2 (rpS2), which is its major in-vivo substrate, and is involved in the proper maturation of the 80S ribosome. Alternative splicing results in multiple transcript variants.	Pancreatic cancer	31324208
PTPRQ	This locus encodes a member of the type III receptor-like protein-tyrosine phosphatase family. The encoded protein catalyzes the dephosphorylation of phosphotyrosine and phosphatidylinositol and plays roles in cellular proliferation and differentiation.	Colorectal cancer	26851024
RLTPR	This gene encodes a member of the CARMIL (capping protein, Arp2/3, myosin-I linker) family of proteins. The encoded protein interacts with and negatively regulates the heterodimeric capping protein and promotes cell migration.	Cutaneous T-cell lymphoma	28694326
SETBP1	This gene encodes a protein which contains a several motifs including a ski homology region and a SET-binding region in addition to three nuclear localization signals. The encoded protein has been shown to bind the SET nuclear oncogene which is involved in DNA replication.	Myeloid malignancies	23832012
SOX4	This intronless gene encodes a member of the SOX (SRY-related HMG-box) family of transcription factors involved in the regulation of embryonic development and in the determination of the cell fate. The encoded protein may act as a transcriptional regulator after forming a protein complex with other proteins, such as syndecan binding protein (syntenin). The protein may function in the apoptosis pathway leading to cell death as well as to tumorigenesis.	Epithelial cancers	28780934

Table S8: 40 drugs used for flow cytometry based HTS

Compounds	Targets
Selumetinib (AZD6244)	MAP2K1, MAPK3, MAPK1
Stattic	STAT3
CYCLOPHOSPHAMMIDE	alkylating agent
CHIDAMIDE	HDAC1, 2, 3, and 10
Trichostatin A (TSA)	ALL HDACS (Except HDAC8)
Semagacestat (LY450139)	APP, NOTCH
TGR1202	PI3Kδ
CRIZOTINIB	c-Met and ALK
IDELASIB	p110δ
17-AAG (Tanespimycin)	HSP90
DECITABINE	DNA methyltransferase
NVP-ADW742	IGF1R
Enzastaurin (LY317615)	PRKCB, PRKCA, PRKCG, PRKCE
RO4929097	γ secretase (NOTCH)
DEXAMETASONE	glucocorticoid
Crenolanib (CP-868596)	PDGFRA, PDGFRB, FLT3 (D842V)
Belinostat (PXD101)	HDAC
Tofacitinib (CP-690550,Tasocitinib)	JAK3
PRALATREXATE	antifolate
GDC-0068	AKT1, AKT2, AKT3
Ruxolitinib (INCBO18424)	JAK1, JAK2
SC144	IL6ST
DAUNORUBICIN	inhibits DNA synthesis
VINCRISTINE	inhibitor of polymerization of microtubules
MK-1775	WEE1
KPT-330	XPO1
CHIR-124	CHEK1
Ganetespib (STA-9090)	HSP90
ABT-263 (Navitoclax)	BCL2, BCL2L1, BCL2L2
AUY922 (NVP-AUY922)	HSP90A, HSP90B
Panobinostat (LBH589)	HDAC
NSC 319726	TP53 (R175)
SN-38	TOP1
THZ1	CDK7
Bortezomib (PS-341)	PSMC1
