

Supplementary Materials: The Tumor Suppressor CYLD Inhibits Mammary Epithelial to Mesenchymal Transition by the Coordinated Inhibition of YAP/TAZ and TGFbeta Signaling

Athanasiou Pseftogas, Konstantinos Xanthopoulos, Theofilos Poutahidis, Chrysanthi Ainali, Dimitra Dafou, Emmanuel Panteris, Joseph G. Kern, Xaralabos Varelas, Alexander Hardas, Christos Gonidas, Anastasia Tsingotidou, Eudoxia Hatzivassiliou, and George Mosialos

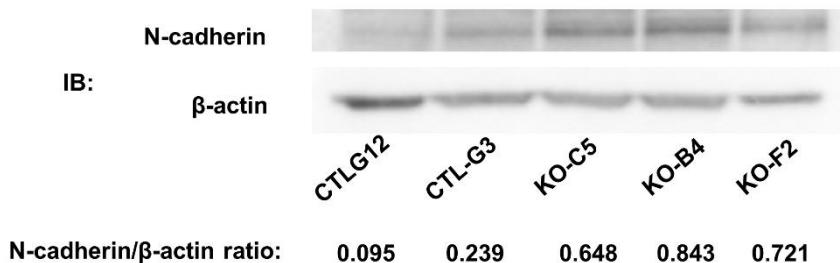

Figure S1. CYLD inactivation upregulates N-cadherin protein expression. Immunoblot analysis of N-cadherin and β -actin expression in whole cell extracts from control (CTL) and CYLD-deficient MCF10A cells (KO-B4, KO-C5 and KO-F2). The indicated ratios of band intensities are shown below the corresponding lane. Representative data from one out of two experiments are shown.

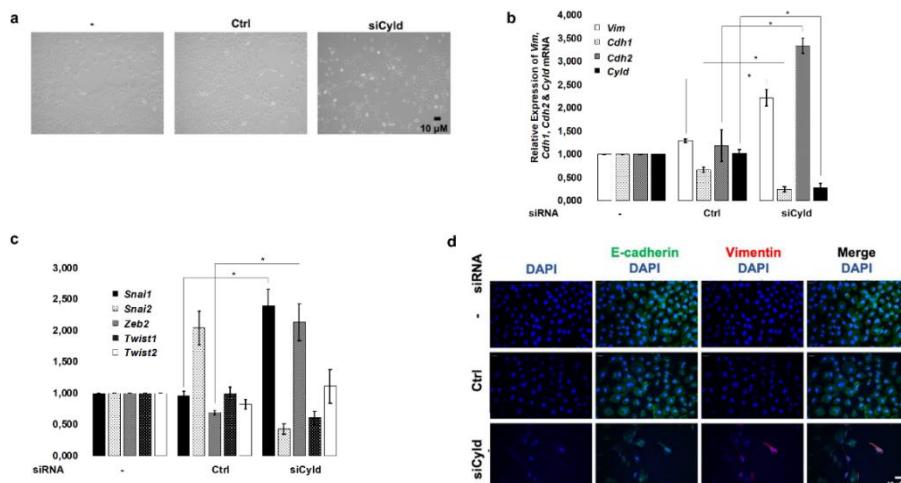

Figure S2. CYLD downregulation leads to EMT-like phenotypic changes in MCF10A cells. **a**) Morphological alteration of MCF10A cells with downregulated CYLD expression. MCF10A cells were transfected with luciferase-targeting (Ctrl) or CYLD-targeting (siCyld) siRNAs, and photographed 48 hours after transfection. **b**) CYLD downregulation leads to reduction of *E-cadherin* (*Cdh1*) and upregulation of *Vimentin* (*Vim*) and *N-cadherin* (*Cdha*) mRNA expression levels. MCF10A cells were transfected with CYLD-targeting (siCyld) or luciferase-targeting (Ctrl) siRNAs. After 48 hours, total RNA was extracted and used to determine the relative levels of the indicated mRNAs using qPCR. The histogram indicates the average values (+/− SE) of relative mRNA levels as determined by the $\Delta\Delta Ct$ method and *YWHAZ* as endogenous control from at least three independent experiments. The statistical analysis of the pairwise comparisons indicated by brackets was performed by the Student's *t*-test method. (* $p \leq 0.05$). **c**) CYLD downregulation induces the mRNA expression of EMT-associated transcription factors Snail1 and ZEB2. MCF10A cells were transfected with CYLD-targeting (siCyld)

or luciferase-targeting (Ctrl) siRNAs. After 48 hours, total RNA was extracted and used to determine the relative levels of the indicated mRNAs using qPCR. The histogram indicates the average values (+/- SE) of relative mRNA levels as determined by the $\Delta\Delta C_T$ method using *YWHAZ* as the endogenous control from at least three independent experiments. The statistical analysis of the pairwise comparisons indicated by brackets was performed by the Student's t-test method. (* $p \leq 0.05$). **d)** Detection of E-cadherin and Vimentin by immunofluorescence in MCF10A cells treated as described in B. Green color represents the staining of E-cadherin, red represents the staining of Vimentin and blue represents the nuclear DNA staining by DAPI.

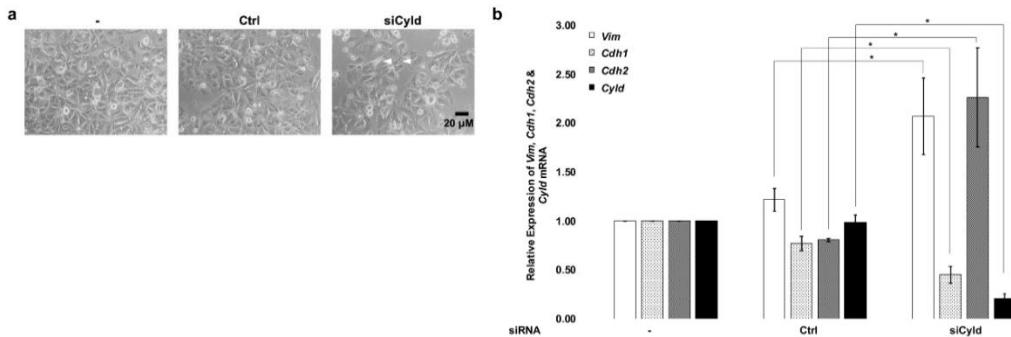

Figure S3. CYLD downregulation induces EMT-like changes in breast cancer cell line MCF7. **a)** Alteration of the epithelial phenotype of MCF7 cells to mesenchymal, following CYLD downregulation. MCF7 cells were transfected with luciferase-targeting (Ctrl) or CYLD-targeting (siCyld) siRNAs, and an EMT-like phenotype (white arrowheads) was observed in more cells with downregulated CYLD compared to controls, 72 hours after transfection. **b)** MCF7 cells were transfected with CYLD-targeting (siCyld) or luciferase-targeting (Ctrl) siRNAs. After 48 hours, total RNA was extracted and used to determine the relative levels of the indicated *Vimentin* (Vim), *E-cadherin* (Cdh1), *N-cadherin* (Cdh2) and CYLD (Cyld) mRNAs by qPCR. The histogram indicates the average values (+/- SE) obtained from at least three independent experiments using the $\Delta\Delta C_T$ method and *YWHAZ* as endogenous control. The statistical analysis of the pairwise comparisons indicated by brackets was performed by the Student's *t*-test method. (* $p \leq 0.05$).

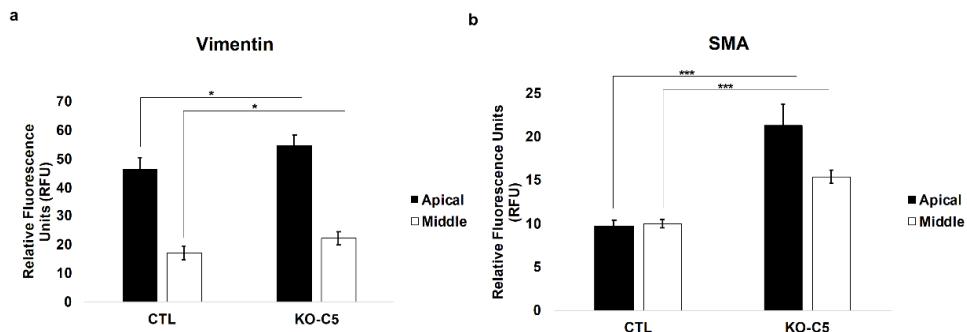

Figure S4. Quantification of the fluorescence intensity of vimentin and SMA staining of figure 2. The relative fluorescence intensity (RFU) of vimentin (**a**) and SMA (**b**) staining of apical and middle sections shown in figure 2 was determined by the ImageJ software. Average values of fluorescence intensities per unit area (+/- SE) from 12 random fields of each image are shown. The statistical analysis of the pairwise comparisons indicated by brackets was performed by the Student's *t*-test method. (* $p \leq 0.05$, *** $p \leq 0.001$).

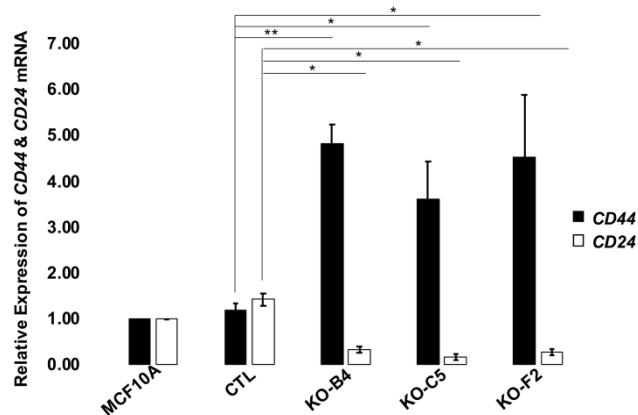

Figure S5. CYLD inactivation upregulates *CD44* and downregulates *CD24* mRNA expression. Total RNA was extracted from control (MCF10A, CTL) and CYLD-deficient MCF10A (KO-B4, KO-C5 and KO-F2) clones and used to determine the relative levels of the indicated mRNAs by qPCR. The histogram indicates the average values (+/- SE) of relative mRNA levels as determined by the $\Delta\Delta C_T$ method and *YWHAZ* as endogenous control from at least three independent experiments. The statistical analysis of relative mRNA expression between the control clone and each clone of the CYLD-deficient clones was performed by the Student's *t*-test method. (* $p \leq 0.05$, ** $p \leq 0.01$).

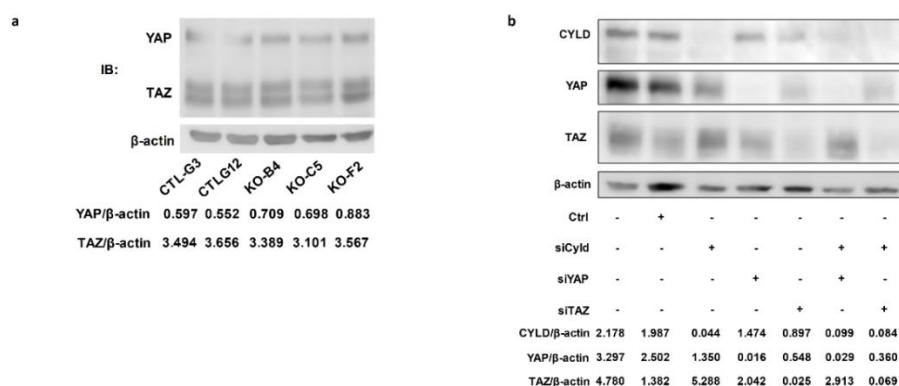

Figure S6. Analysis of YAP, TAZ and CYLD expression by immunoblotting. **(a)** Immunoblot analysis of YAP, TAZ and β -actin expression in whole cell extracts from control (CTL-G3, CTL-G12) and CYLD-deficient MCF10A cells (KO-B4, KO-C5 and KO-F2). The indicated ratios of band intensities are shown below the corresponding lane. **(b)** Evaluation of siRNA-mediated downregulation of CYLD, YAP and TAZ. Immunoblot analysis of whole cell extracts obtained from MCF10A cells that were transfected with CYLD-targeting (siCyld), YAP-targeting (siYap), TAZ-targeting (siTaz) or luciferase-targeting (Ctrl) siRNAs as indicated. The indicated ratios of band intensities are shown below the corresponding lane.

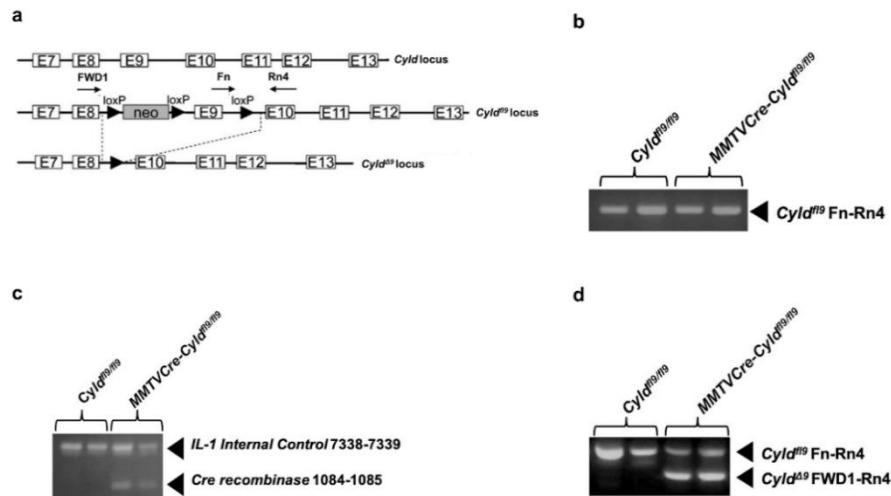

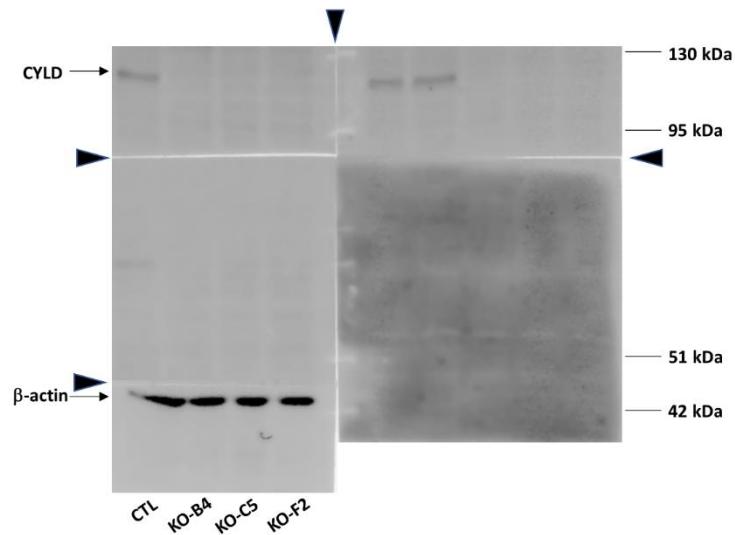

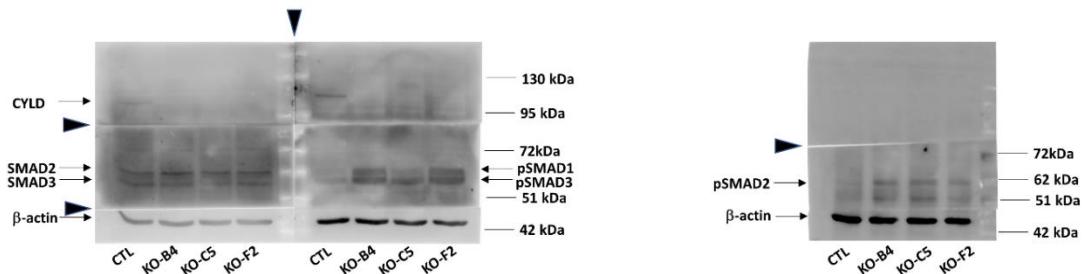

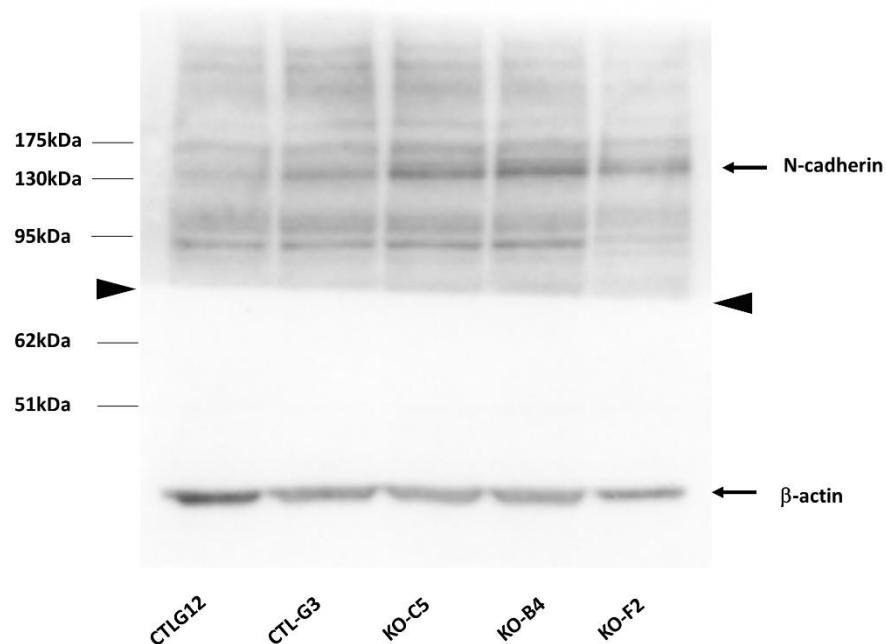

Figure S7. Generation of mice with mammary-specific deletion of *CYLD* exon 9 (MMTVCre-*Cyld*^{f/f}^{Δ9/Δ9}). **a)** Schematic representation of exons 7–13 (E7-E13) of the murine *CYLD* locus (*Cyld* locus). The structures of the floxed *CYLD* locus in the absence (*Cyld*^{f/f} locus) and presence (*Cyld*^{Δ9} locus) of the Cre recombinase are shown. The loxP sites are shown as solid triangles. The positions of primers FWD1, Fn and Rn4 are marked by arrows. **b)** PCR-based detection of the *Cyld*^{f/f} allele (*Cyld*^{f/f} Fn-Rn4) in genomic DNA obtained from the tails of *Cyld*^{f/f} and MMTVCre-*Cyld*^{f/f}^{Δ9/Δ9} mice. Genomic DNA from *Cyld*^{f/f} mice was used as negative control. **c)** PCR-based detection of the *Cre* recombinase gene in genomic DNA obtained from the tails of MMTVCre-*Cyld*^{f/f}^{Δ9/Δ9} mice. Genomic DNA from *Cyld*^{f/f} mice was used as negative control. **d)** PCR-based detection of the *Cre*-mediated recombination product (*Cyld*^{Δ9} FWD1-Rn4) in mammary gland genomic DNA isolated from MMTVCre-*Cyld*^{f/f}^{Δ9/Δ9} mice. Mammary gland genomic DNA from *Cyld*^{f/f} mice was used as negative control.

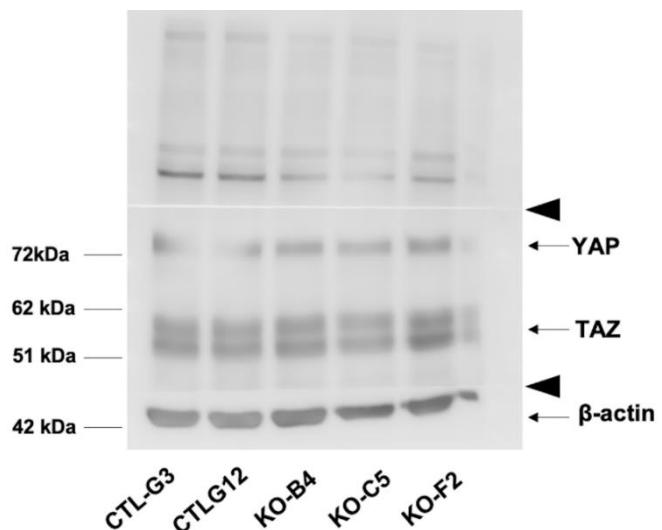

Uncropped image of Figure 1a.

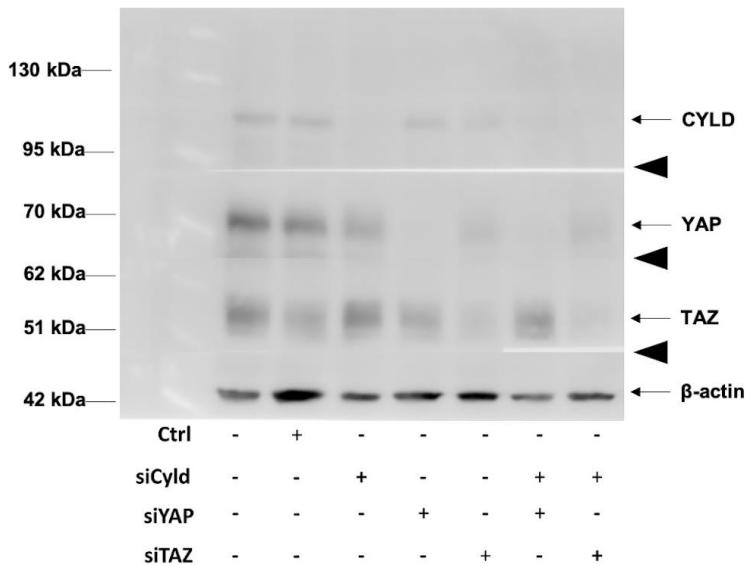

Uncropped images that were used for the composition of Figure 4a.

Uncropped images that were used for the composition of Figure S1.

Uncropped image that was used for the composition of Figure S6a.

Uncropped image that was used for the composition of Figure S6b.

Figure S8. Uncropped images of the Western blots shown in figures 1,4,S1, and S6. The nitrocellulose membranes were cut at the positions indicated by the dark arrowheads and incubated separately with antibodies that recognize the indicated proteins. At the end of the immunoblotting process the membrane pieces were placed next to each other and scanned in order to obtain the provided images.

Table S1. sgRNA sequences used for CRISPR/Cas9-mediated *CYLD* mutagenesis.

Name	Start Site	Strand	Sequence (5'-3')	PAM Sequence
2.3 (Exon 2)	50783781	+	ATCGTTCTGTGGGGCATTCA	AGG
3.2 (Exon 3)	50785678	+	GCATTGAAAGTGATTACGC	AGG

Table S4. List of the top 500 genes with the highest variability between YAP-expressing and YAP-deficient mouse gut organoid cultures. We have utilized differentially expressed genes from RNA sequencing data analyses previously deposited in the GEO repository under accession number GSE66567. RNA sequencing experiments were performed with RNA isolated from gut organoid cultures derived from at least three independent YAP deficient mice with genotypes *Yap*^{fl/fl}; *villin*-cre (Day1_Het), *Yap*^{fl/fl}; *villin*-cre (Day1_KO) and *Yap*Tg (Dox_minus_Yap and Dox_plus_Yap). Variability across genes within samples facilitated the detection of genes that are driving YAP-dependent regeneration and tumorigenesis. We estimated the variance for each row in the logcounts matrix ('var_genes <- apply(logcounts, 1, var) and selected the top 500 genes with the highest variability and defined this data-set as YAP-dependent for future queries.
