Figure S1. Distribution of CN ratio of *AR-En*, *AR-E1*, *AR-E8*, and *OPHN1* in 14 gDNA controls. Mean CN ratio for each locus is 1.01 (Range 0.84–1.32) for *AR-En*, 0.92 (Range 0.69–1.30) for *AR-E1*, 1.08 (Range 0.86–1.41) for *AR-E8*, and 1.12 (Range 0.96–1.29) for *OPHN1*.

Figure S2. Stability of reference control genes (A) and correlation of different controls in Assay I and Assay II (B).

Figure S3. Heatmap of the amplification of AR loci (1Mb bin) and association of amplification of AR-E1 and OPHN1 with OS. (A). Heatmap showed the amplification of AR (1Mb bin covering AR-En, AR-E1, and AR-E8) in 13 samples with co-amplification of AR-En, AR-E1, and AR-E8. Association of amplification of AR-E1 and OPHN1 with OS. Although showing clear trend of poor OS, the amplifications at the two sites (B,C) do not reach statistical significance when cutoff > 1.92. (D). AR-E1 showed significant association with OS when the cutoff of amplification call > 1.8.
