Multi-Omics Data in CoMMpass Study

Multi-omics data about bone marrow MM samples at baseline (BM_1) were freely accessible from MMRF CoMMpass Study (<https://research.themmr.org/>) and retrieved from the Interim Analysis 15a (MMRF_CoMMpass_IA15a).

Information about t(11;14) occurrence was inferred from CCND1 spike expression estimates from RNA-sequencing (RNA-seq) data (MMRF_CoMMpass_IA15a_RNAseq_Canonical_Ig_Translocations) and Transcript per Million (TPM) reads values of the investigated transcripts were obtained by Salmon gene expression quantification (MMRF_CoMMpass_IA15a_E74GTF_Salmon_V7.2_Filtered_Gene_TPM) in 774 BM_1 MM patients. Clinical data regarding Overall Survival (OS) and Progression free Survival (PFS) were considered in 767 MM patients for which both RNA-seq expression and survival data were available. Non-synonymous (NS) somatic mutation variants and counts data were obtained

from whole exome sequencing (WES) analyses, main IgH translocations were inferred from RNA-seq spike expression estimates of known target genes and Copy Number Alteration (CNA) data were retrieved by means of Next generation Sequencing (NGS)-based fluorescence in situ hybridization (FISH) ² in 497 MM cases for which all data were available ³.

The presence of a specific CNA was considered when occurring in at least one of the investigated cytoband at a 20 percent cut-off for each considered chromosomal aberration, as previously reported ³.

Survival and statistical analyses

Survival analyses were performed using survival and survminer packages in R Bioconductor (version 4.0.0). Kaplan-Meier analysis was applied on OS and PFS data in 767 MM cohort stratified in high/low expression group according to median cut-off on lncRNAs expression levels. Log-Rank test p-value was calculated to measure the global difference between survival curves. The number of samples at risk in each group across time was calculated.

Cox proportional hazards model was applied as univariate analysis on single molecular variables and International Staging System (ISS) groups in relation to OS and PFS data, in 497 MM cases for which all information were accessible and significant features with p-value < 0.05 were tested by Cox regression multivariate analysis.

Wilcoxon and Kruskal-Wallis tests were applied to assess the differences in gene expression levels between two or more groups. Benjamini-Hochberg correction was applied to global p-values. Dunn's test was used to assess pairwise comparisons between multiple groups. Fisher's exact test was performed to verify the association of high/low lncRNA expression groups with main molecular aberrations investigated in CoMMpass cohort.

Functional annotation enrichment analysis

Gene Set Enrichment Analysis (GSEA) ⁴ was performed under default conditions on pre-ranked protein coding gene list based on fold-change values. Hallmark, Reactome, KEGG and C2-Gene Perturbations, filtered for Multiple Myeloma term and Gene Ontology (GO) gene sets (version 7.1), were selected on the base of nominal p-value < 0.05.

Cluster Profiler analysis ⁵ was performed in R environment on DE global protein coding gene list and the top (BH adjusted pvalue) GSEA gene sets, based on Gene-Ontology (GO) Biological Process (BP) terms, were selected. Cnetplot function was applied to depict the linkages of genes and biological GO terms as a network.

Functional enrichment analysis by means of the database for annotation, visualization and integrated discovery (DAVID) 6.8 ⁶, which can be freely accessed at <http://david.abcc.ncifcrf.gov/>, was performed at high stringency by means of functional annotation clustering on GO terms. Significant annotation clusters were selected on the base of Enrichment Score >1.3 and representative GO annotation terms were reported for each cluster.

Supplementary Table S5. List of positively (red) or negatively (blue) enriched gene sets in pPCL with t(11;14) compared to MM cases with t(11;14), by GSEA analysis on pre-ranked 628 protein coding gene list. Gene sets (version 7.1) are selected according to nominal p-value (<0.05), and ordered according to Normalized Enrichment Score (NES) in each gene set collection. Size, NES, Nominal p-value, and FDR q-value are reported for each gene set.

Supplementary Table S10. Results of Cox regression multivariate analysis for selected lncRNAs in high versus low expression group, together with significant clinical and molecular variables respectively in PFS and OS, in 497 MM patients of CoMMpass cohort. The number (N) and percentage of MM cases at higher expression levels are reported for each lncRNA. Hazard Ratio (HR) and 95% Confidence Interval (95% CI) are reported for each variable. Global p-value from Log-Rank test is also indicated for each analysis.

Supplementary Figure S2: Results of Dunn's test evaluating the differences in the expression of BCL2 gene family in MM and pPCL stratified by the presence of t(11;14), and in normal controls (N). Significant p-value<0.05 is marked red-bold. Expression levels are plotted in Figure 3B-C .

SupplementaryFigure S3: Quantitative RT-PCR validation of BCL2, BCL2L1, and MCL1 expression levels. **(A)** Pearson's correlation coefficient was calculated between GEP data and quantitative RT-PCR results expressed as $2^{-\Delta Ct}$ in 16 samples. **(B)** Box plot representation of the gene expression levels in 34 samples including 6 normal controls (N), 9 MM patients carrying t(11;14), 10 MMs without t(11;14), 3 pPCL patients carrying t(11;14), and 6 pPCLs without t(11;14) evaluated by Kruskal-Wallis test (p-values are shown for each panel). The expression levels are represented as $2^{-\Delta Ct}$. In each panel, red dashed lines above two groups indicate significant differences in their gene expression level, blue asterisks indicate significant differences between the indicated group and N evaluated by Dunn's test (table under the corresponding box plot, significant p-value < 0.05 is marked red-bold).

Supplementary Figure S4: Box plot representation of the mRNA expression of BCL2 family genes in 156 MM with t(11;14) and 618 MM without t(11;14) from the CoMMpass database. For each plot BH adjusted p-value is reported.
