[22] = common-ALL

[25] = B-other

[21] = pre-B-ALL

[57] = 3 KMT2A-ENL & 3 KMT2A-AF4

[58] = SNP G>A rs10406069 in miR-5196 associated with higher levels and hyperdiploid subtype → AG significantly lower SMC1A expression (p<0.01) than GG, a gene involved in sister chromatin cohesion and lower ARHGEF3 expression, a guanine

nucleotide exchange factor for Rho GTPase. We also have to take into account that miR-5196 is hosted in the CD22 gene, where rs10406069 produces a missense mutation (p.Gly745Asp) in exon 12. Although the association could be due to its impact on the host gene, the effect of this SNP in the protein is predicted to be benign.

[13] = common-ALL not just B-ALL

[5] = includes adult cases too

[54] = TLX3-related vs T-ALL

[36] = has data comparing ALL subgroups with normal cells https://www.haematologica.org/article/view/5966

[62] = pro-B-ALL highest DICER expression and lowest AGO2 expression vs controls (pre-B-ALL significant difference -but not in that extent)

ERG-related cases = remarkably favorable outcome despite a high incidence of inauspicious IKZF1 aberrations
