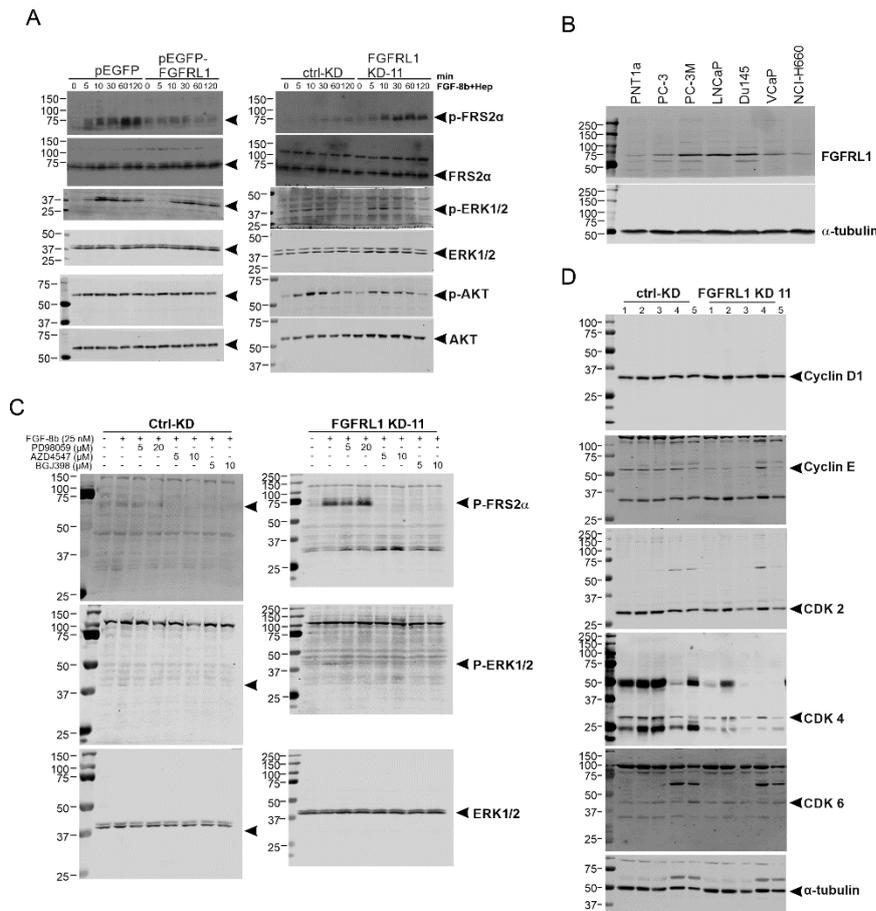

Figure S1. Uncropped western blots referring to the ones included in the current article. A) Figure 3, B) Figure S4, C) Figure S5, and D) Figure S7.

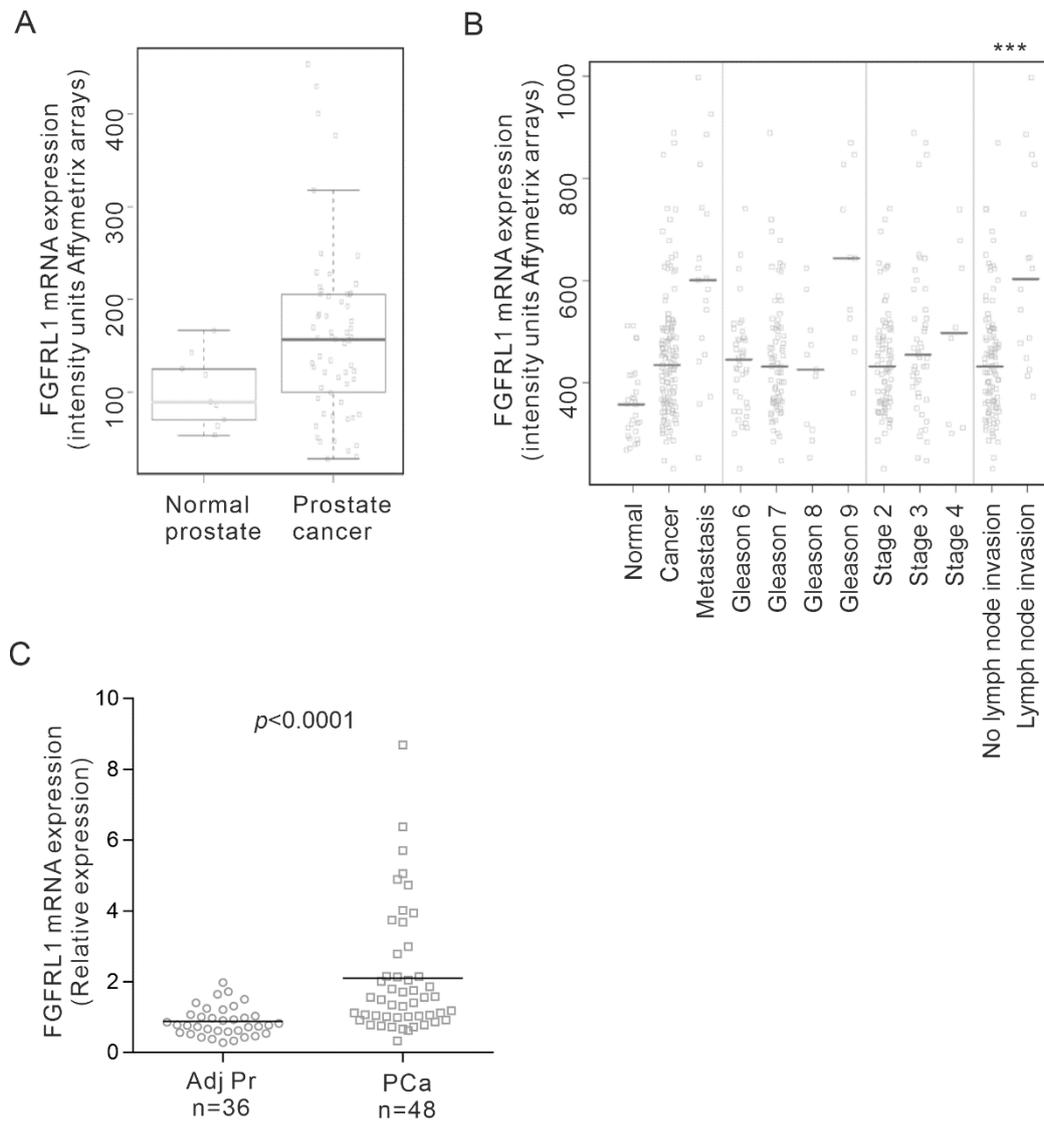

Figure S2. FGFR1 mRNA expression in prostate cancer. (A), In silico analysis of FGFR1 mRNA expression in normal prostate tissues and prostate adenocarcinomas in the IST dataset (Medisapiens Oy, Helsinki). (B), Detailed in silico analysis of FGFR1 mRNA expression and correlation with different clinical parameters in the MSKCC 2010 data set. *** $p < 0.001$. (C), Relative mRNA expression of FGFR1 was analyzed in adjacent benign prostate (AdjPr) and cancerous prostate (PCa) by qPCR from specimens containing >50% of corresponding epithelium.

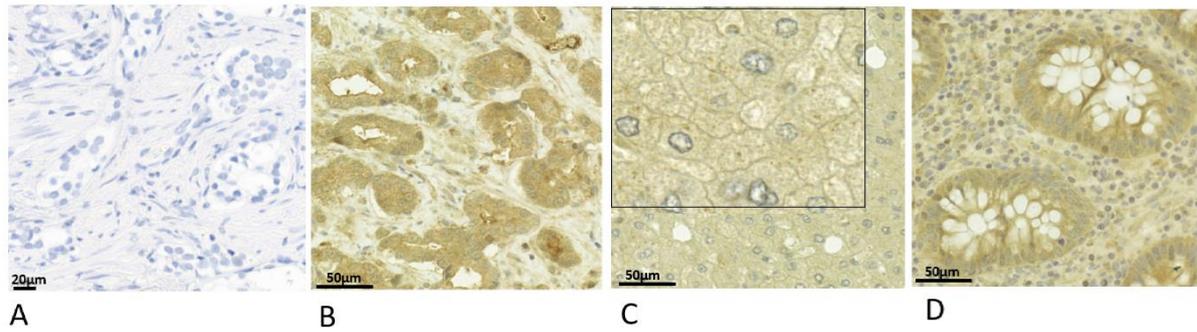

Figure S3. Immunohistochemical staining controls for FGFR1. (A), Negative control (primary antibody ab95940 omitted). (B), Example of strong immunostaining, tissue sample from prostate cancer specimen. (C-D), Positive controls used in tissue microarrays (TMAs). Liver, cytoplasmic and membranous (inset) staining of hepatocytes (C) and staining of colon (D).

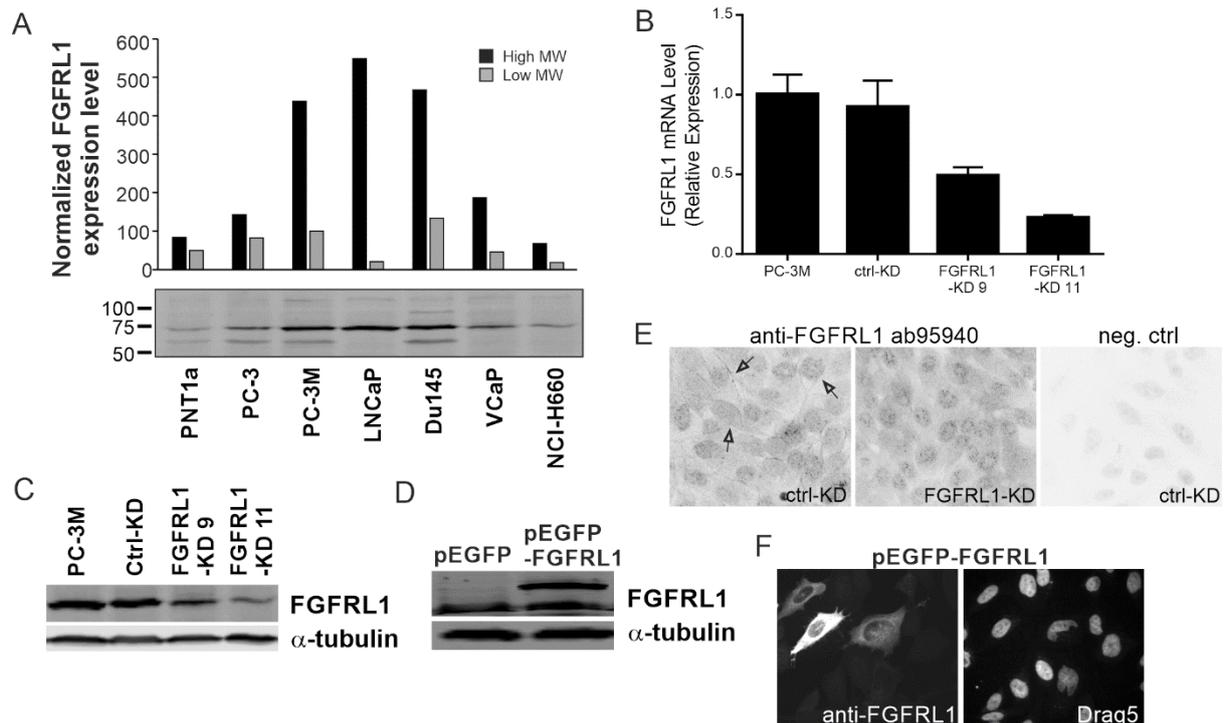

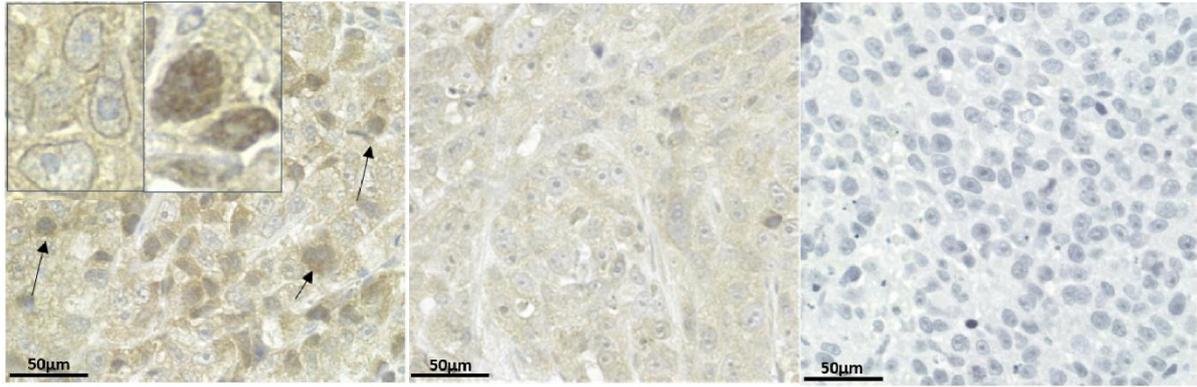

Figure S4. FGFR1 expression in prostate cancer cell lines and characterization of transfected cells.

(A), Prostate cancer cell line lysates were analyzed for FGFR1 expression by Western blot. Alpha-tubulin was used as a loading control. (B-C), FGFR1 mRNA (B) and protein (C) levels were analyzed in parental PC3M cells, knockdown mock-transfected cells (ctrl-KD), and FGFR1 knockdown cells (FGFR1-KD 9 and 11) using qRT-PCR and Western blot, respectively. (D), Protein levels of FGFR1 were analyzed in pEGFP-control vector and pEGFP-FGFR1-expression vector transfected PC3M cells by Western blot. Western blot signal intensities were quantitated with ImageJ and relative signal levels are shown below the blot. (E), Endogenous expression of FGFR1 was detected in ctrl-KD and FGFR1-KD cells with immunofluorescence staining (arrows indicate FGFR1 staining at cell membranes in ctrl-KD cells). Objective 63x. (F), Immunofluorescence staining of FGFR1 protein in pEGFP-FGFR1-expression vector transfected PC3M cells. Draq5 was used to stain the nuclei. Objective 40x.

Figure S5. The effects of FGFR inhibitors on PC3M FGFR1-KD prostate cancer cells. (A), Ctrl-KD and FGFR1-KD cells were cultured in organotypic 3D cultures in the presence of 5% FBS and BGJ398, AZD4547 or 0.1% DMSO as a control (preculture 4 days and treated for 8 days). Cells were stained with Calcein-AM (green) and Ethidiumhomodimer-1 (red) for living and dead cells, respectively, and imaged using confocal microscope. Representative confocal image stack projections (upper rows) and image segmentation by AMIDA software (lower rows) are shown. (B), Quantitative morphometric image analysis of phenotypic features observed in 3D cultures was performed using AMIDA. Bonferroni-corrected *t*-tests (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$). The total number of analyzed objects (in 6 replicate wells) is indicated under the whisker of the box and whisker plots. (C), Cell proliferation of ctrl-KD and FGFR1-KD cells *in vitro* in 2D cultures, treated with BGJ398 and AZD4547 in the presence of 5% FBS. (D), Western blot analysis of FRS2 α and ERK1/2 phosphorylation in ctrl-KD and FGFR1-KD cells upon treatment with the MEK1/2 inhibitor PD98059 and FGFR inhibitors AZD4547 and BGJ398. Total ERK1/2 was used as a loading control. Note the enhanced signalling response to FGF-treatment in FGFR1-KD cells. Western blot signal intensities were quantitated with ImageJ and relative signal levels are shown below the blot.

Figure S6. FGFR1 immunostaining of xenografts. (A), FGFR1 (control) xenografts (insets show examples of membranous staining and strong cytoplasmic staining, arrows nuclear staining). (B), FGFR1-KD xenografts. (C), Negative control (primary antibody ab 95940 omitted)

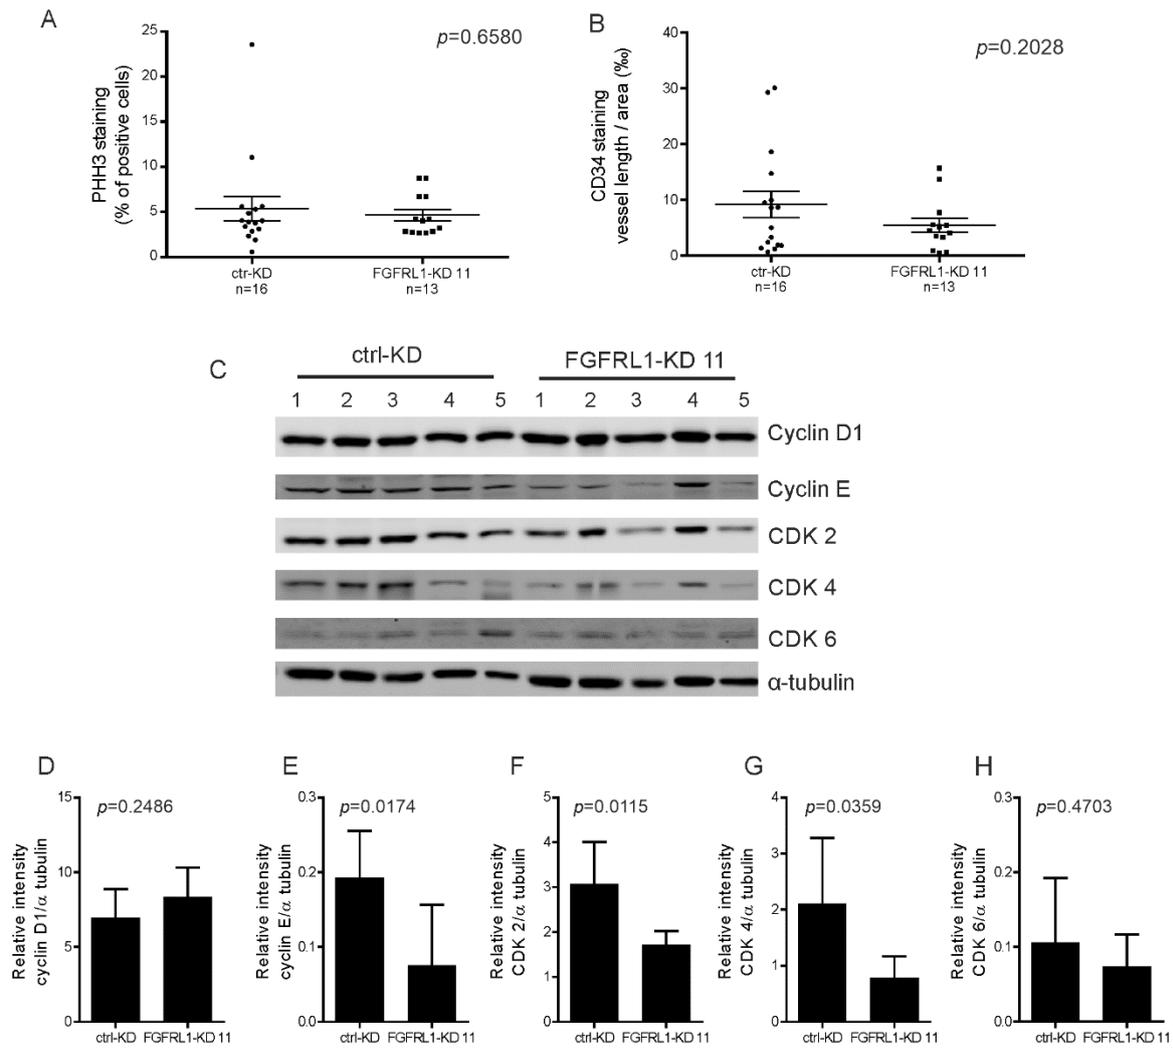

Figure S7. Immunohistochemical and Western blot analyses of xenograft tumors. (A), Percentage of positive PHH3-stained cells and (B), CD34-stained capillaries in xenografts. Four images of each xenograft were analyzed to determine the proportion of PHH3 positive tumor cells. Length of all CD34-stained blood vessels was compared to total tumor area. (C), Tumor lysates from 5 ctrl-KD and 5 FGFR1-KD xenografts were used to examine cell cycle-related proteins. Alpha-tubulin was used as a loading control. (D-H), Intensities of cyclin D1, cyclin E, CDK2, 4, 6 bands were measured and related to the loading control α -tubulin. t-test was used in statistical analysis

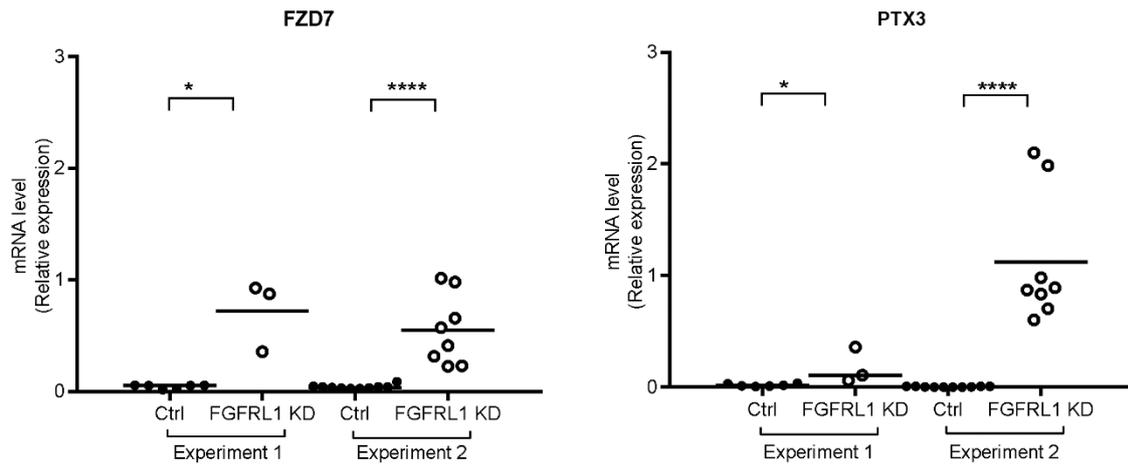

Figure S8. Validation of differential expressions of target genes FZD7 and PTX3 in xenografts formed by control versus FGFR1-KD cells. Expression was determined in 2 independent experiments with 9 (6 control, 3 KD) and 18 mice (10 control, 8 KD), respectively. * $p < 0.05$, **** $p < 0.0001$.
