

Supplementary Figure S15: Kaplan Meier graphs comparing SU-SD groups stratified by ACRG subtypes. Tumor samples in GSE62254 were separated into four distinct gastric tumor sub-groups previously defined by the Asian Cancer Research Group (ACRG); MSI, MSS/EMT, MSS/TP53+ (MSS with intact TP53 activity), MSS/TP53- (MSS with TP53 functional loss). Prognostic difference between SU and SD groups was evaluated within each group. Overall survival was used as clinical outcome. Log-rank p values are indicated.
