**Table S2-6: Functional ROIs.**

Here we present supplementary tables including functional ROIs of every patient. Overall, 51 fROIs were identified. Due to intra- and inter-subject variability, which are common in clinical fMRI of brain tumors, not all the areas were active at every timepoint and across patients. Active areas in the left (L) and right (R) hemisphere included: inferior frontal gyrus opercular part (OP BROCA), inferior frontal gyrus triangular part (TRI BROCA), inferior frontal gyrus orbital part (IF ORBITAL), middle frontal gyrus (MFG), middle frontal gyrus anterior division (A MFG), dorsal pre-motor cortex (D PREMOTOR), ventral pre-motor cortex (V PREMOTOR), frontal eye field (FEF), precentral gyrus (PRECENTRAL), post-central gyrus (POSTCENTRAL), Wernicke's area (WERNICKE), supramarginal gyrus (S MARGINAL), angular gyrus (ANG GYRUS), superior parietal lobule (S PARIETAL), precuneus, insula, insular-opercular angle (IOA), hippocampus, thalamus, caudate nucleus (CAUDATE), basal ganglia (BG), visual word form area (VWFA), cerebellum, pre-supplementary motor area (SMA). In some cases, an anatomical subdivision of the functional area was possible, for example when a separate activation was present in the opercular and/or triangular part of the inferior frontal gyrus (Broca's area). In these cases the labeling followed the anatomic subdivision, while in the other cases it followed the general cluster (BROCA).

**Table S2** Active clusters for patient 1 at different timepoints (threshold criteria  $r>0.5$ ;uncorrected  $p = 2 \times 10^{-11}$ ).
