**Figure S2: A:** Multiple sequence alignment of  $\gamma$ -CAs from hydrothermal vent organisms as well as  $\gamma$ -CAs from other environments used to create the phylogenetic tree in B. The black box shows the variable loop containing the His proton shuttle. The red circles show the  $Zn^{2+}$  coordinating residues and the green circle shows the position of the His proton shuttle. Sequences from hydrothermal vents are labelled in red. **B:** Phylogenetic tree constructed for  $\gamma$ -CA sequences from hydrothermal vent organisms as well as  $\gamma$ -CAs from other environments, alongside the pairwise sequence identity heatmap. The Maximum Likelihood method was applied using the LGGI protein model with 95% gap deletion and the bootstrap values are displayed as percentages of 1000 bootstraps on the branch nodes.

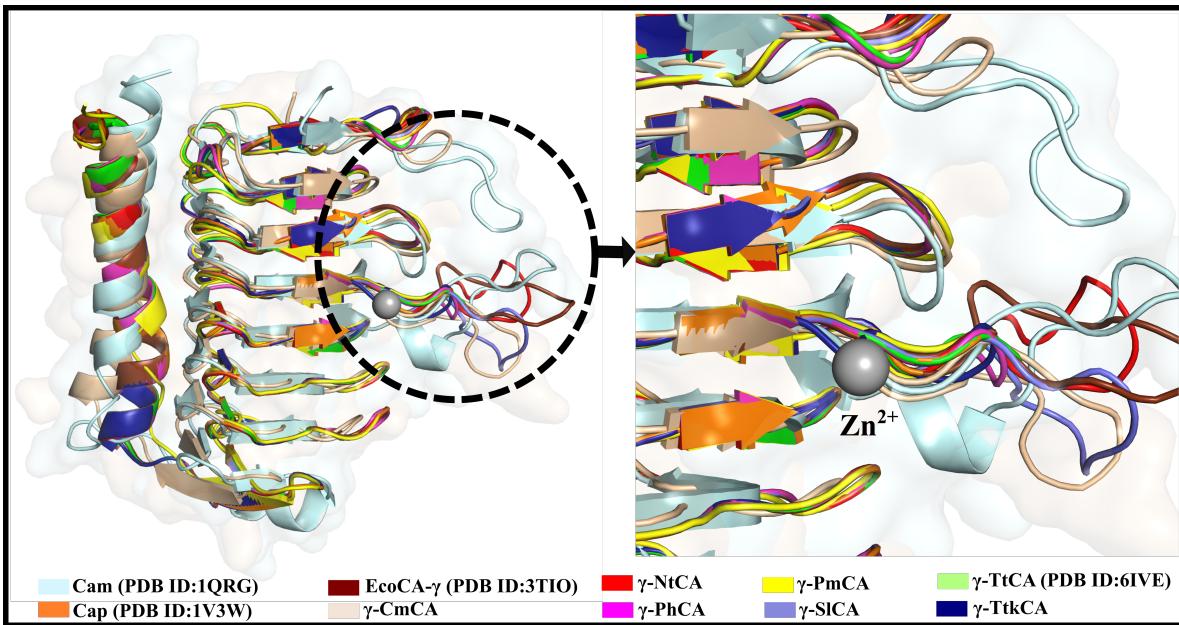

Figure S3: Monomer structure alignment of  $\gamma$ -CAs from *Methanoscincus thermophilus* (Cam, PDB ID: 1QRL, cyan), *Pyrococcus horikoshii* (Cap, PDB ID: 1V3W, orange), *Escherichia coli* (EcoCA- $\gamma$ , UniProtKB Accession number: P0A9W9.1, brick red), *Caminibacter mediatlanticus* ( $\gamma$ -CmCA, wheat), *Nitratiruptor tergarcus* ( $\gamma$ -NtCA, red), *Persephonella hydrogeniphila* ( $\gamma$ -PhCA, magenta), *Persephonella marina* ( $\gamma$ -PmCA, yellow), *Sulfurovum lithotrophicum* ( $\gamma$ -SICA, slate blue), *Thermus thermophilus* ( $\gamma$ -TtCA, PDB ID: 6IVE, green) and *Thermosulfidobacter takaii* ( $\gamma$ -TtkCA, navy blue). The variable loop region containing the proton shuttling residue is shown in the black dotted circled and zoomed in the image pointed to by the black arrow.
