1.1. X-ray Single-Crystal Determination of 2

The crystal of **2** was immersed in cryo-oil, mounted in a loop, and measured at a temperature of 120 K. The X-ray diffraction data was collected on a Rigaku Oxford Diffraction Supernova diffractometer using Cu K α radiation. The *CrysAlisPro* [1] software package was used for cell refinement and data reduction. A multi-scan absorption correction (*CrysAlisPro* [1]) was applied to the intensities before structure solution. The structure was solved by the intrinsic phasing (*SHELXT*) [2] method. Structural refinement was carried out using *SHELXL* [2] software with the *SHELXLE* [3] graphical user interface. The NH hydrogen atom was located from the difference Fourier map and refined isotropically. All other hydrogen atoms were positioned geometrically and constrained to ride on their parent atoms, with C-H = 0.95 Å and U_{iso} = 1.2·U_{eq}(parent atom).

1.2. Hirshfeld Surface Analysis

The topology analyses were performed using the Crystal Explorer 17.5 program [4].

1.3. Computational Methods

The structure of the studied compound was optimized using the B3LYP/6-31G(d,p) method utilizing Gaussian 09 software [5]. Atomic charges were calculated using the NBO 3.1 program [6]. Additionally, the different electron delocalization processes which stabilize the studied system by conjugation effect were calculated using natural bond orbital calculations [7,8].

Table S1. The calculated geometric parameters of **2^a**.

Parameter	Calc	Exp	Parameter	Calc	Exp
R(1-17)	1.223	1.249	A(1-17-2)	125.3	123.2
