The thermal characterization of the curing kinetics has been done by means of differential scanning calorimetry (DSC). The composites were cured at 90 °C and subsequently characterized by DSC. Figure S1 shows the DSC thermograms of the composites with PA6 and PA6 veils modified with 25 % TiO<sub>2</sub>. More specifically, Figure S1 (a) shows the residual reaction heat obtained in the first heating step and Figure S1 (b) shows the glass transition temperature of the fully cured material. Table 1 shows the residual heat obtained for each configuration of composite with PA6 veil and modified PA6 veil with 25 % TiO<sub>2</sub> and the conversion degree for each sample calculated considering full conversion of the DGEBA-DDM system [1]. The residual heat values obtained for the composites with the modified veil are quite similar to those obtained for the unmodified veil, focusing on a range between 16–20 J/g, which results in a similar conversion degree of each composite system. It could be said that neither the incorporation of the PA6 veil nor the modified PA6 veil affects the curing of the composite material.

**Figure S1.** DSC thermograms of the composites with PA6 and PA6 modified with with 25 % TiO<sub>2</sub> veils (a) 1st heating and (b) 2nd heating.

**Table S1.** DSC values of the composites with PA6 and PA6 modified with with 25 % TiO<sub>2</sub> veils.

Material	$\Delta H_{res}$ (J/g)	$\alpha$ (%)
Referencia	18.8	96.4
1 Velo PA6 Ultramid	20.3	96.2
3 Velos PA6 Ultramid	16.9	96.8

1 Velo PA6 Ultramid + 25 % TiO <sub>2</sub>	20.5	96.1
3 Velos PA6 Ultramid + 25 % TiO <sub>2</sub>	21.5	95.9

Figure S2, shows the flexural strength and deformation of the carbon fibre/epoxy composites with PA6 and 25 wt.% of TiO<sub>2</sub> modified PA6 electrospun nanofibre veils, along with the values for reference composites

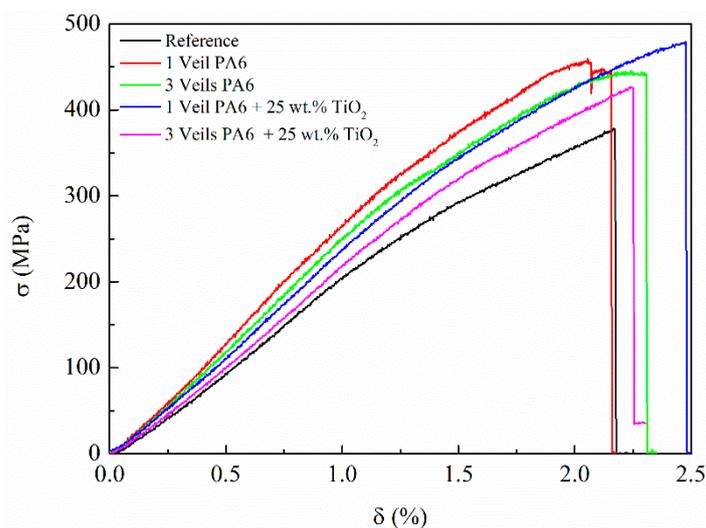

Figure S2. Flexural strength and deformation curves.
