## Content

**Table S1.** The dissolution time of Epoxy1 in different alcohol solvents.

**Table S2.** Summary of the reported degradable epoxy resins based on transesterification reactions between ester bonds and hydroxyl groups.

**Figure S1.** FTIR spectra of Epoxy5 cured at 150 °C for different hours.

**Figure S2.** Stress relaxation curves of Epoxy1 at different temperatures.

**Figure S3.** The etherification reaction between DGEBA and DMP-30.

**Figure S4.** The uniaxial tensile test process of REP5-20.

**Figure S5.** Properties of reprocessed Epoxy4 containing different amounts of DEO.

**Table S1.** The dissolution time of Epoxy1 in different alcohol solvents.

| Solvent           | Boiling point(°C) | Chemical structure  | Dissolution temperature (°C) | Dissolution time  |
|-------------------|-------------------|---|------------------------------|-------------------|
| Ethanol           | 78                |  | 140                          | 2 days            |
| Ethylene glycol   | 197               |  | 140<br>180                   | 170 min<br>70 min |
| 2-Ethyl-1-Hexanol | 183-186           |  | 180                          | 4 days            |
| Propylene Glycol  | 187               |  | 180                          | 90 min            |

**Table S2.** Summary of the reported degradable epoxy resins based on transesterification reactions between ester bonds and hydroxyl groups.

| Starting materials                        | $T_g$ (°C) | Rubbery modulus (MPa) | Elastic modulus (MPa) | Tensile strength (MPa) | $T_{5\%}$ (°C) | Stress relaxation time (s) |
|---|------------|-----------------------|-----------------------|------------------------|----------------|----------------------------|
| DGEBA/fatty acids/Zn(Ac) <sub>2</sub> [1] | 30         | 2.5                   | 3.8                   | 3.0                    | 350            | 600 at 200 °C              |
| DGEBA/GA/Zn(Ac) <sub>2</sub> [2]          | 63         | 15                    | 728.3                 | 37.7                   | 390            | 109 at 220 °C              |
| BPA/TGDDM/DA [3]                          | 20         | 2.9                   | 3.3                   | 3.2                    | Not reported   | 3200 at 200 °C             |
| Eu-EP/SA/Zn(Ac) <sub>2</sub> [4]          | 53         | Not reported          | Not reported          | 25                     | 310            | 128 at 200 °C              |

**Figure S1.** FTIR spectra of Epoxy5 cured at 150 °C for different hours.**Figure S2.** Stress relaxation curves of Epoxy1 at different temperatures. Stress relaxation tests of epoxy resins were performed on an MCR 302 rheometer (Anton Paar, Austria) equipped with a 25 mm circular parallel plate. The circular specimen with a thickness of ~1 mm and a diameter of 25mm was heated to the designed temperature and equilibrated for 10 min. A 1.5 N normal force and a 1% strain were then applied to the sample, and the deformation was maintained during the measurement. The relaxation modulus of epoxy resin as a function of time was recorded.

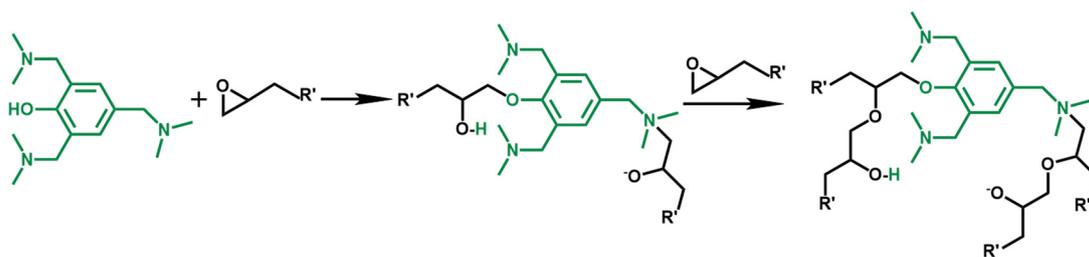

Figure S3. The etherification reaction between DGEBA and DMP-30.

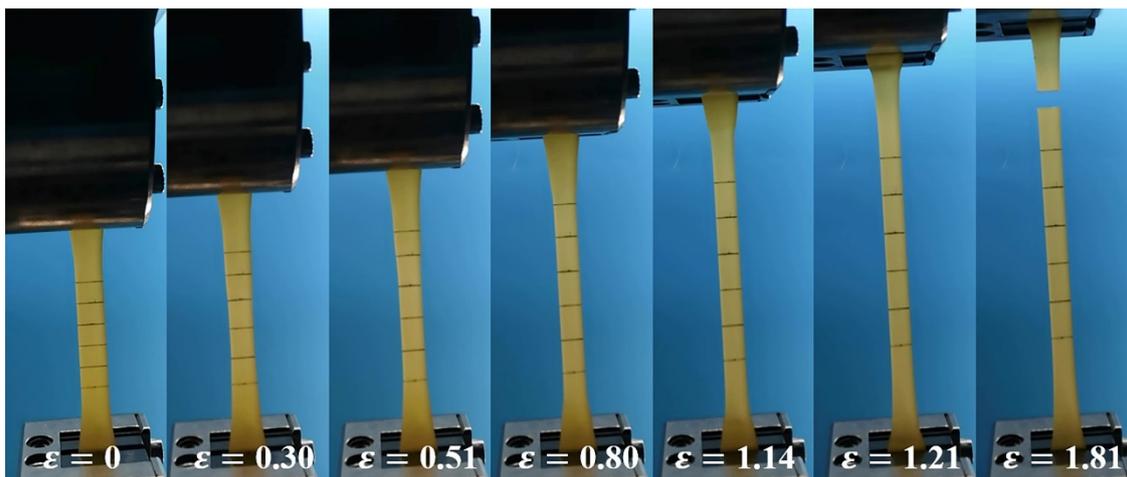

Figure S4. The uniaxial tensile test process of REP5-20.

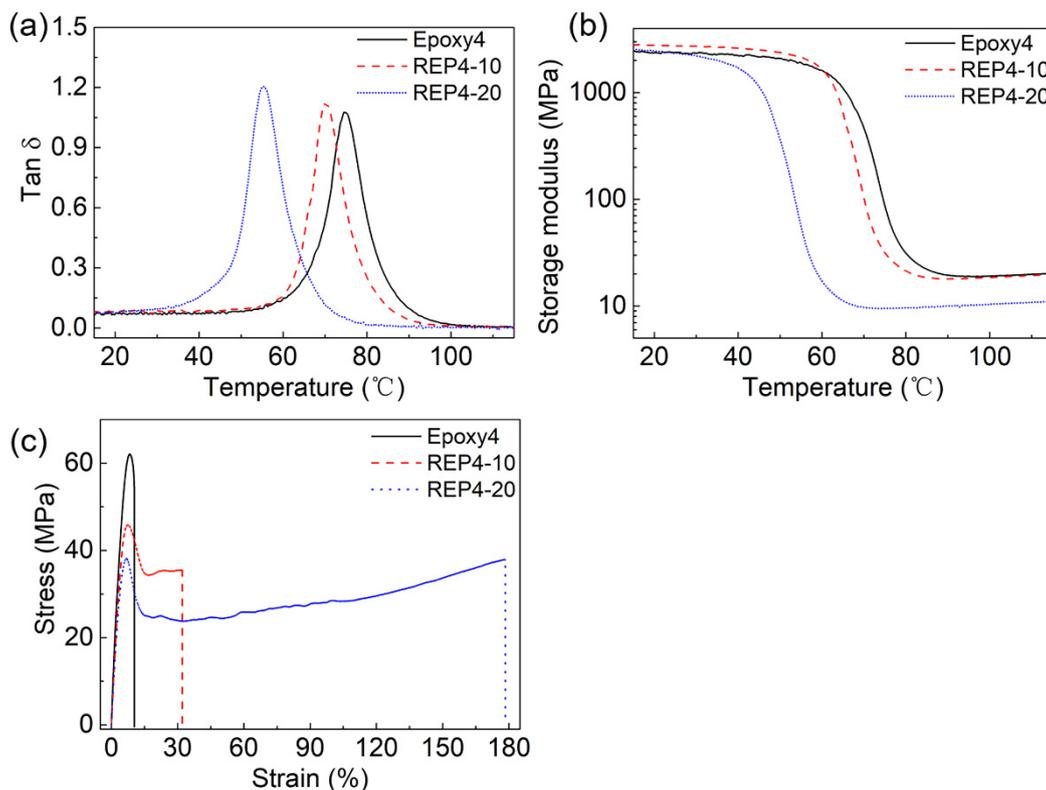

Figure S5. Properties of reprocessed Epoxy4 containing different amounts of DEO: (a) Tan  $\delta$  curves as a function of temperature. (b) Storage modulus curves as a function of temperature. (c) Tensile stress-strain curves.
