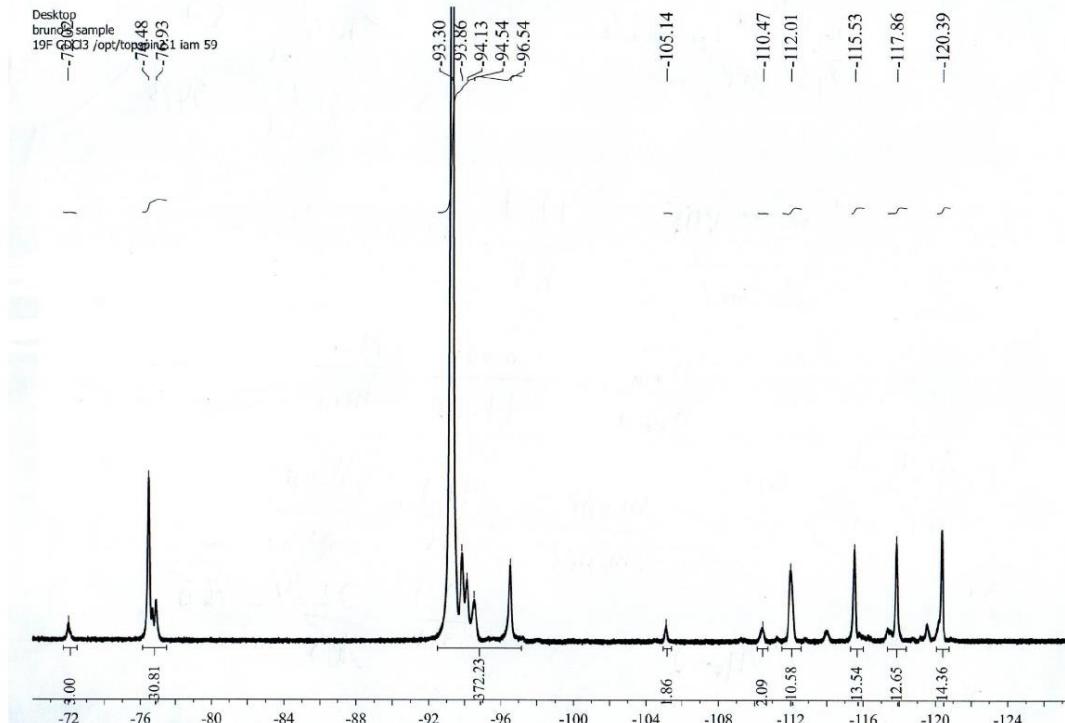

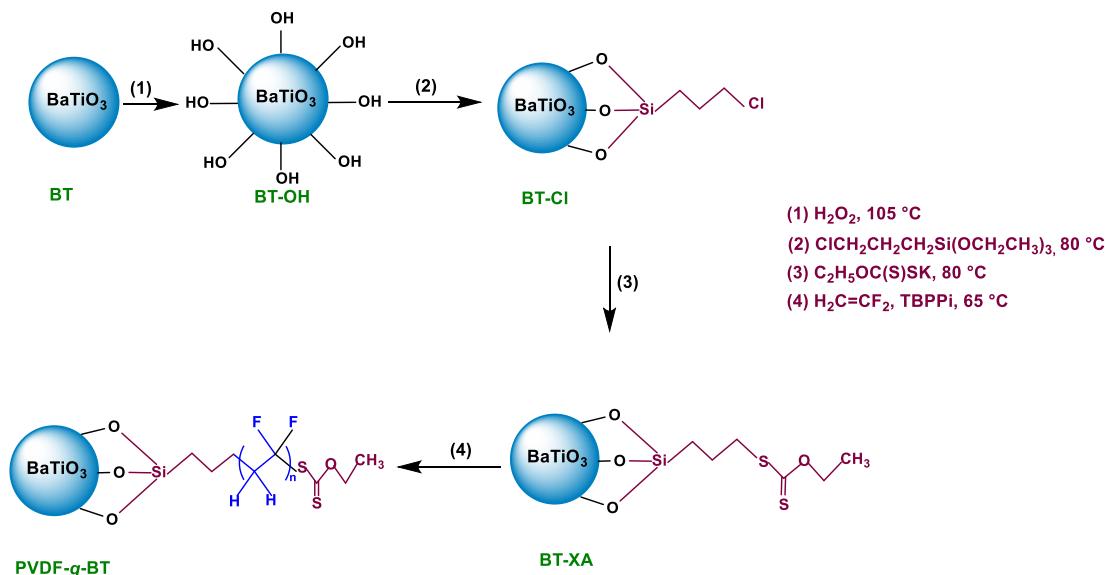

Figure S1. ¹⁹F NMR spectrum of commercially available P(VDF-co-HFP) recorded in CDCl_3 .

The VDF content was determined using Equation (1), and was estimated to be 97 mol %.

$$mol.\% VDF = \frac{\int_{-92.0}^{-119} VDF/2}{\int_{-92.0}^{-119} VDF/2 + \int_{-119.5}^{-120.5} HFP/2}$$

Scheme S1. Sketch illustrating the synthesis process of PVDF-g-BaTiO₃ nanocomposites by RAFT polymerization of VDF in the presence of Xanthates (from the modification of BaTiO₃ nanoparticles) where TBPPi stands for *tert*-butyl peroxy pivalate [1].

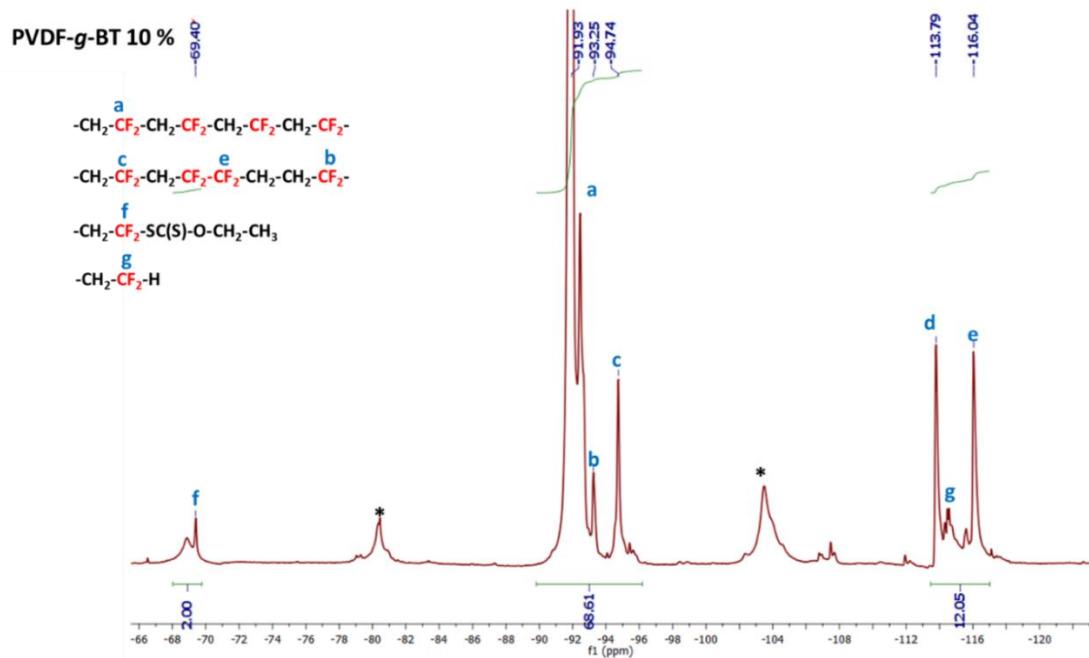

Figure S2. Expansion of the -64 to -120 ppm region of the ¹⁹F HRMAS spectrum recorded in d₆-DMSO of PVDF-g-BaTiO₃ nanocomposite filled with 10 wt % of BaTiO₃ (*) stands for the spinning bands).

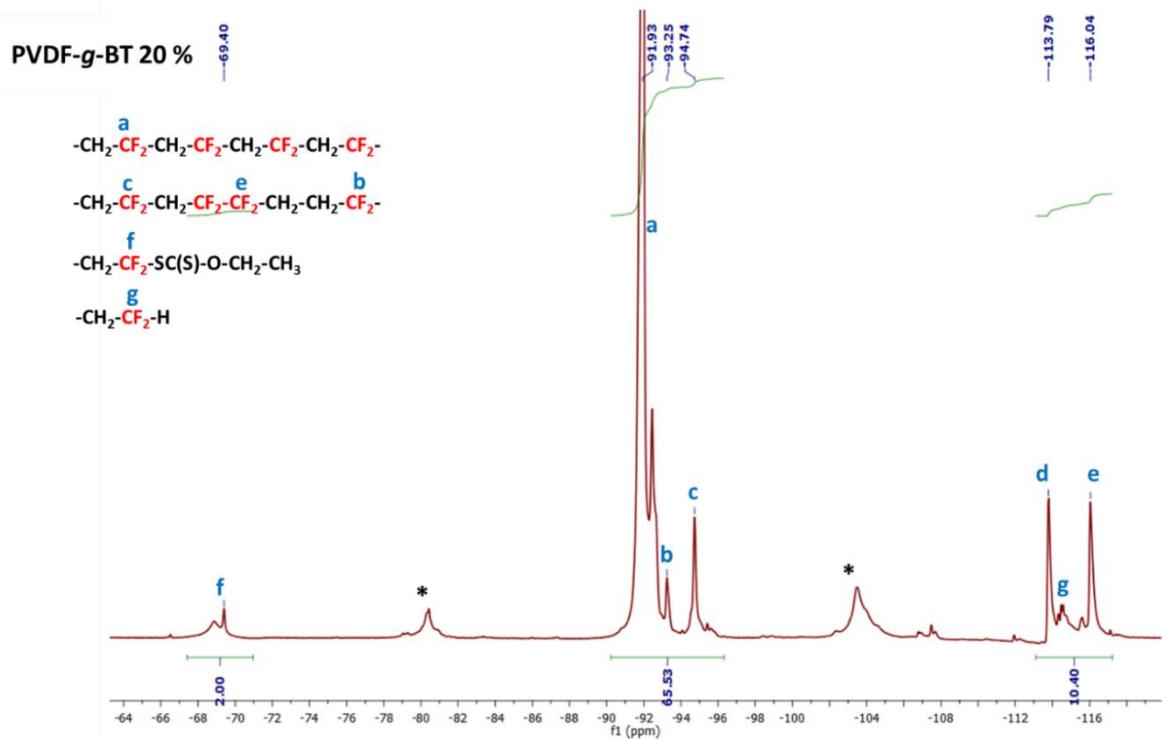

Figure S3. Expansion of the -64 to -120 ppm region of the ^{19}F HRMAS spectrum recorded in d_6 -DMSO of PVDF-g-BaTiO₃ nanocomposite filled with 20 wt % of BaTiO₃ (* stands for the spinning bands).

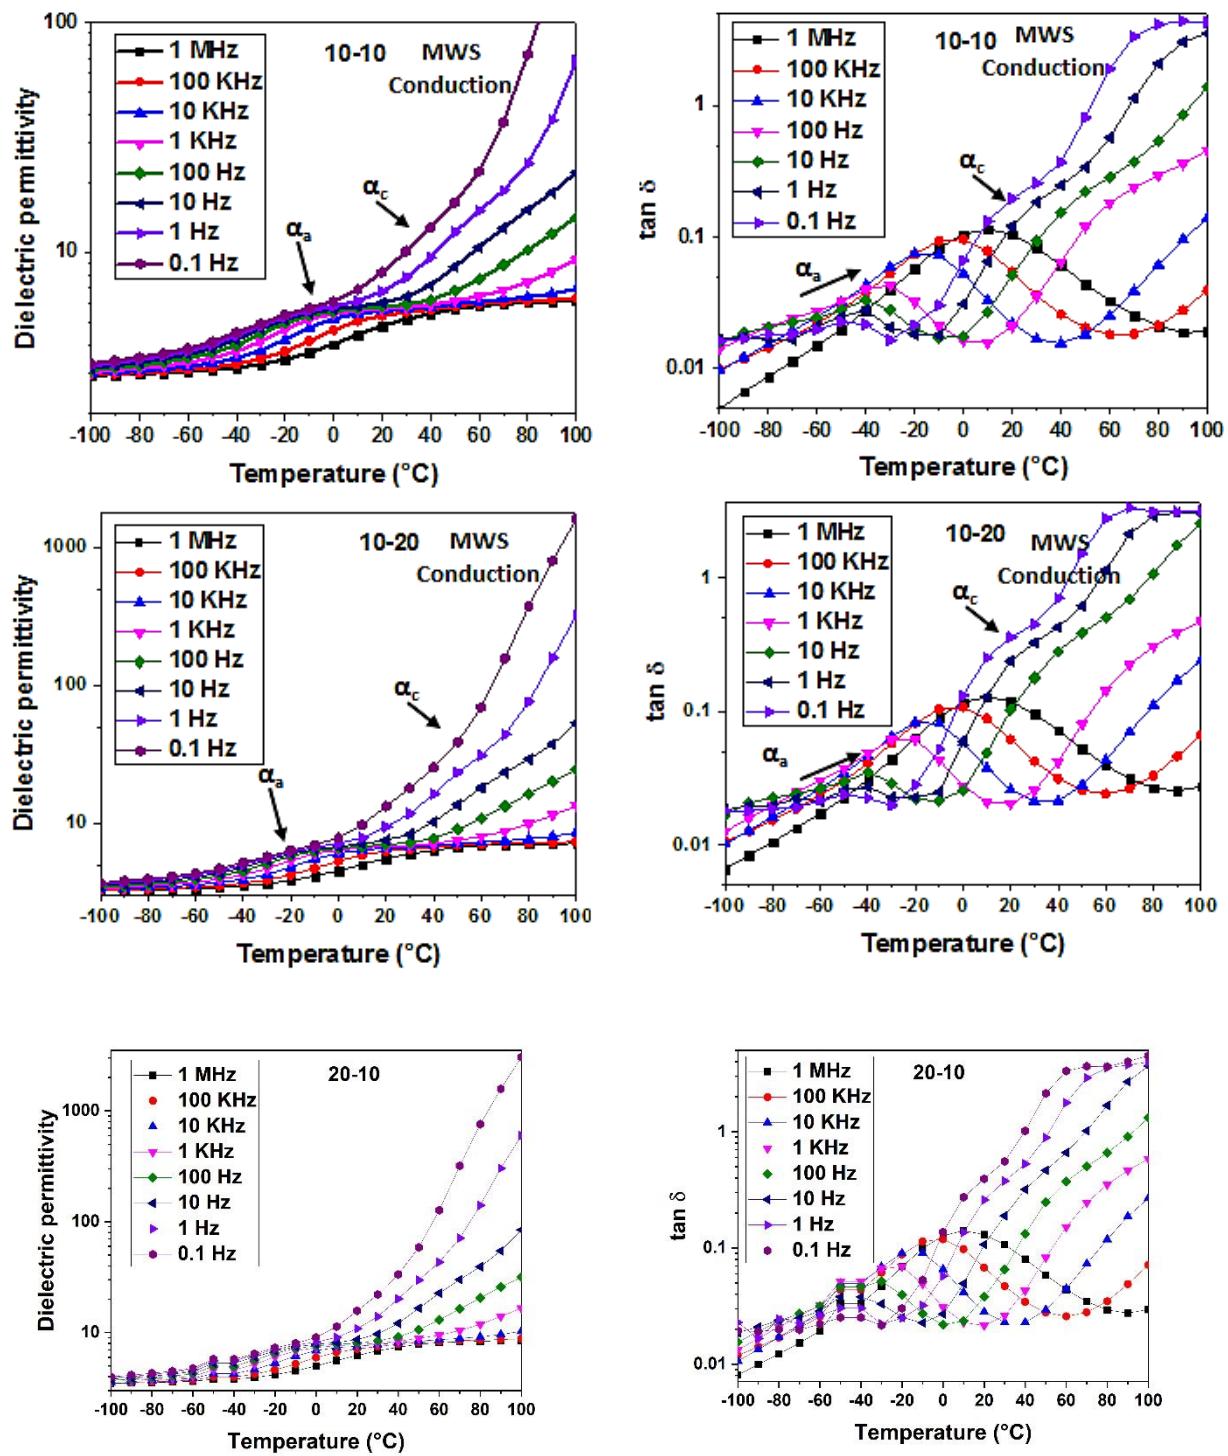

Figure S4. Dielectric permittivity, ϵ' , (left) and loss tangent, $\tan \delta$, (right) of 10-10, 10-20, and 20-10 nanocomposites films *versus* temperature at different frequencies.

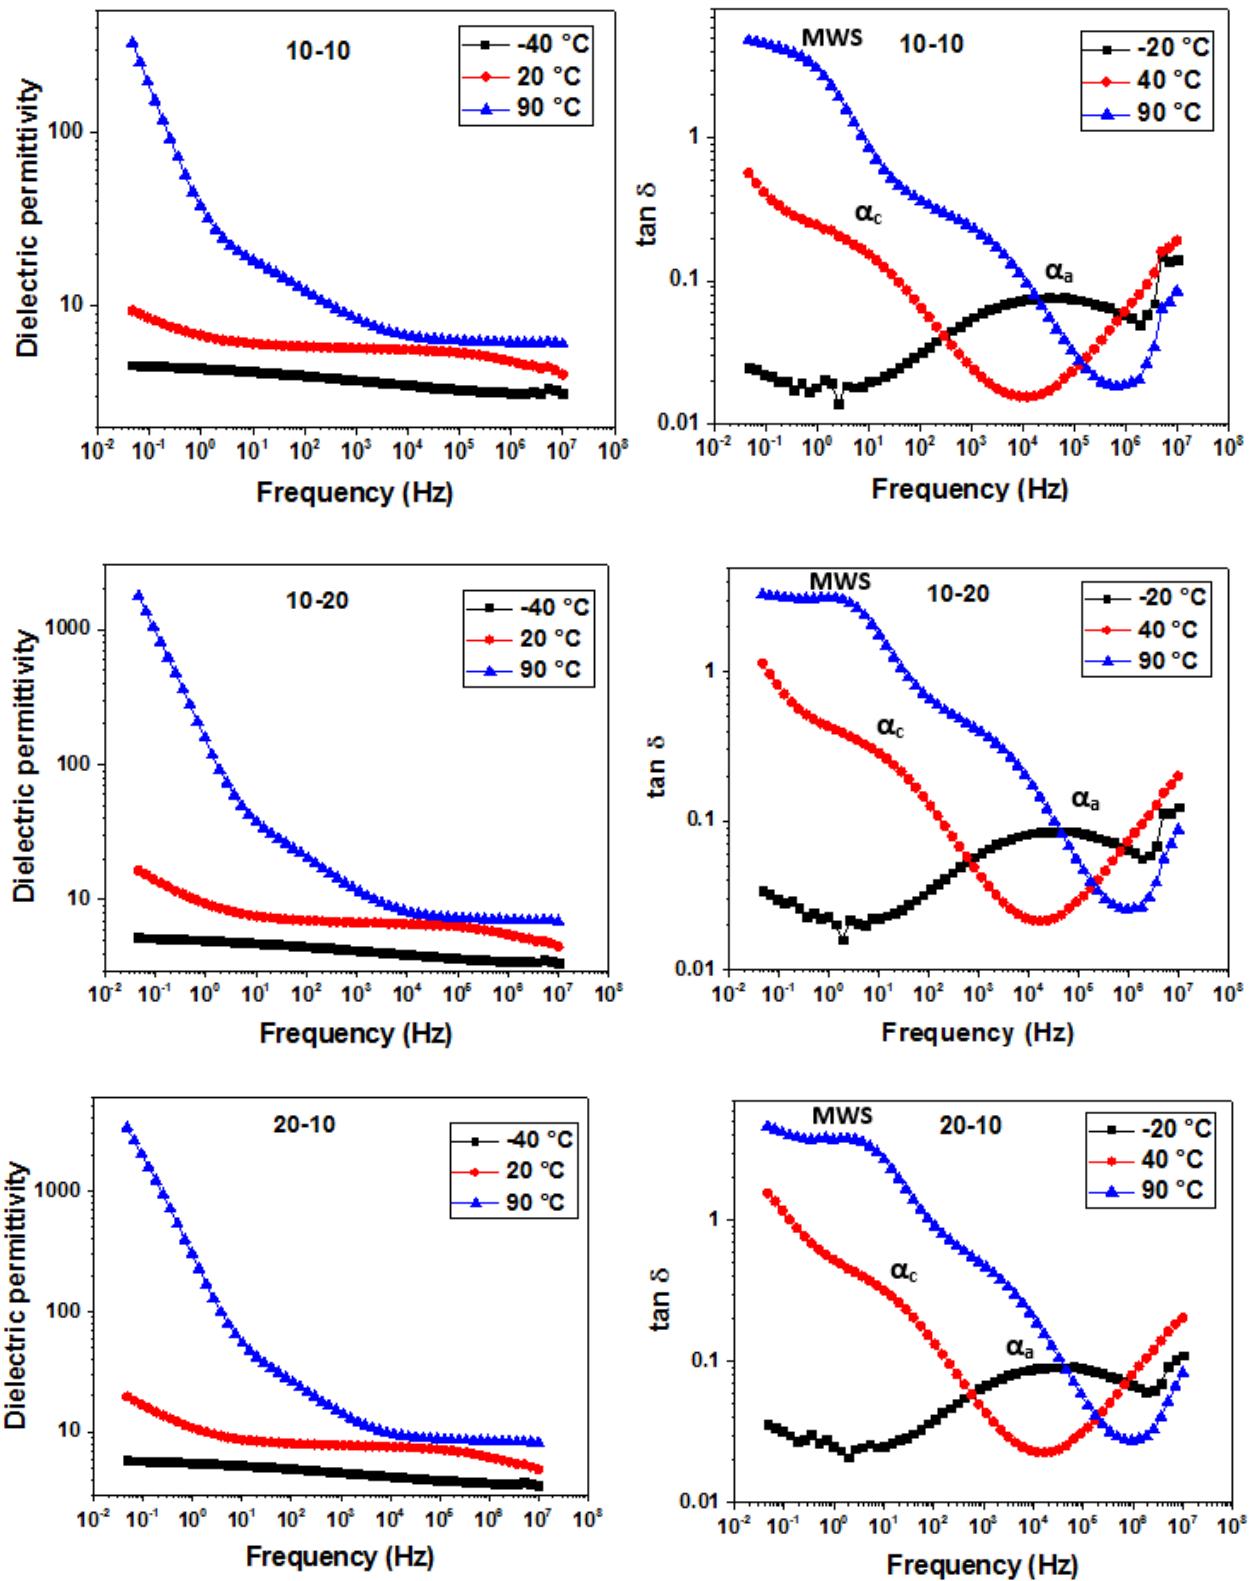

Figure S5. Selected representative isothermal spectra recorder for ϵ' and $\tan \delta$ of the 10-10, 10-20 and 20-10 nanocomposite films.

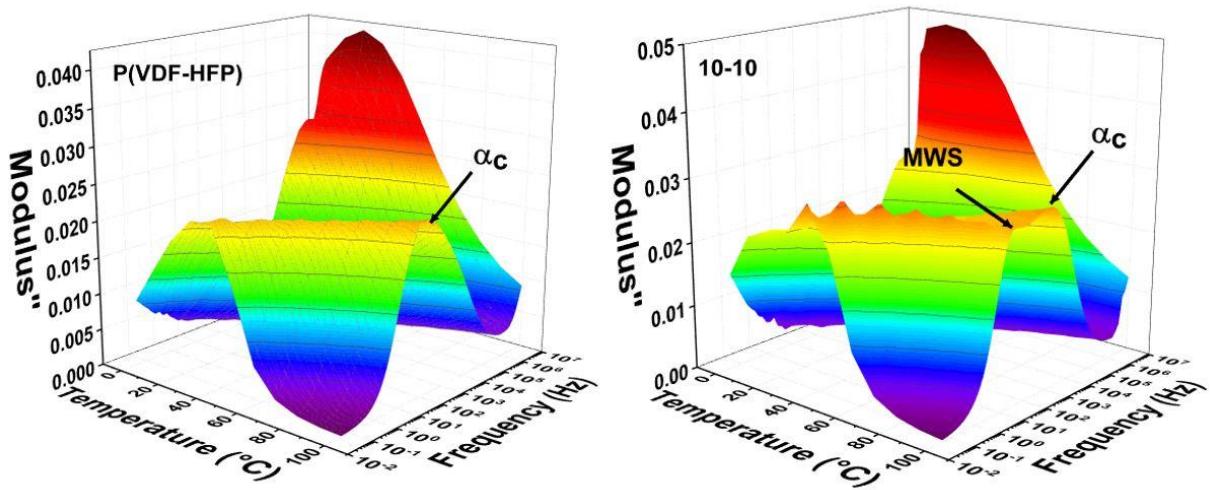

Figure S6. Frequency dependence of the dielectric loss modulus (Modulus'', or M'') of pristine P(VDF-*co*-HFP) and of its 10-10 nanocomposite film at different temperatures.

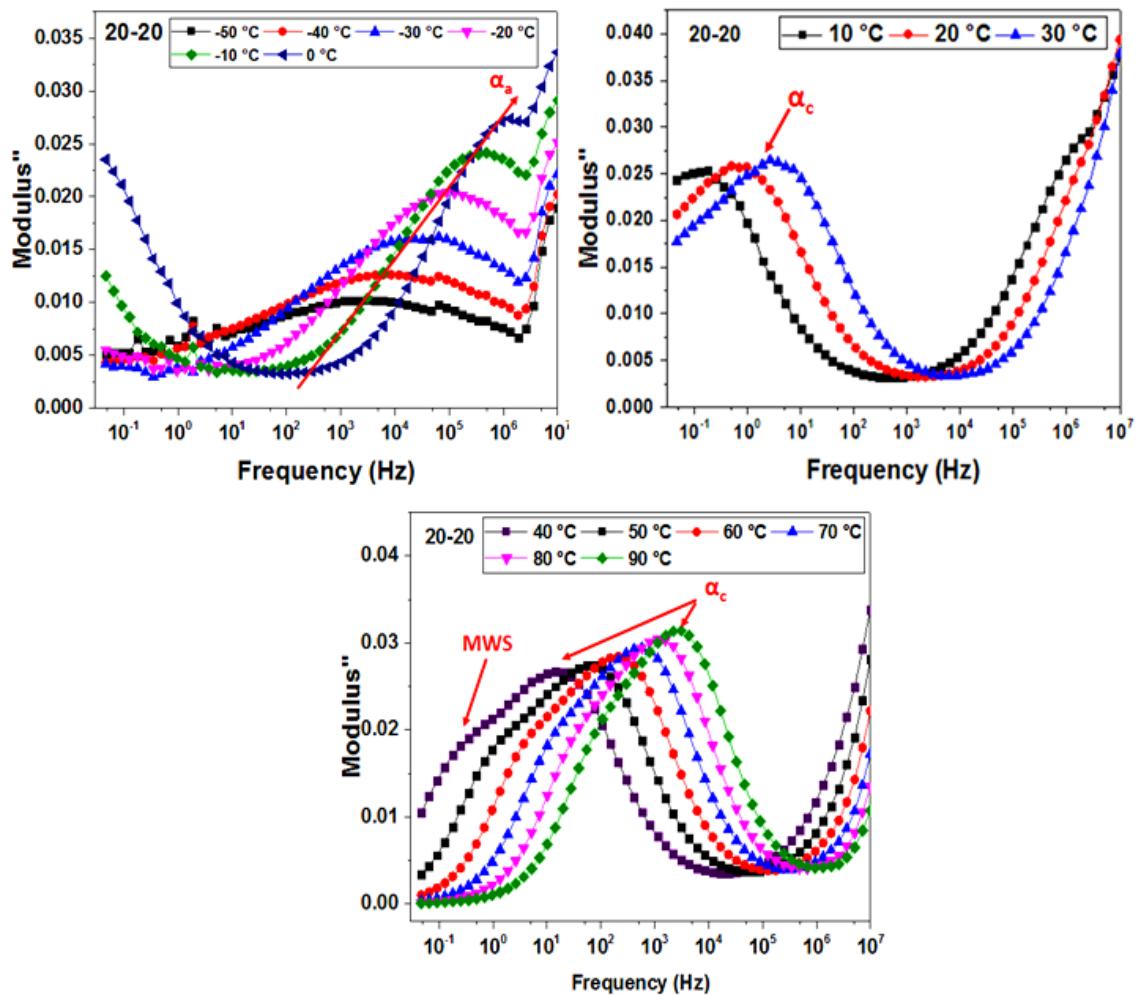

Figure S7. Modulus M'' versus frequency at different temperatures of the 20-20 nanocomposite film.
