

Supplementary Materials: Fabrication of Alkoxyamine-Functionalized Magnetic Core–Shell Microspheres via Reflux Precipitation Polymerization for Glycopeptide Enrichment

Meng Yu, Yi Di, Ying Zhang, Yuting Zhang, Jia Guo, Haojie Lu and Changchun Wang

The density of alkoxyamine group can be calculated according to TGA results. For the MSP@PNAMAm and MSP@PNAMAm, the final residual weight percentages of both two samples in 600 °C represented the inorganic magnetic core. For 1 g MSP@PNAMAm, we can use W_1/W_2 to represent the corresponding MSP@PNAMAm mass, and the differ $(W_1 - W_2)/W_2$ was caused by the deprotection, the loss of phthalimide group. So the mole of phthalimide in 1 g MSP@PNAMAm can be calculated by the formula below:

$$d = (W_1 - W_2)/(W_2 \times M_{pt}) \quad (1)$$

Where M_{pt} is the differ molecular weight caused by deprotection, the value is 132 g/mol. The d value could also represent the density of alkoxyamine group.
