Phenotypic descriptions and growth stages according to the BBCH scale [47]:

<sup>a</sup> emergence of cotyledons through soil surface

<sup>b</sup> main stem of 10% of its final length

<sup>c</sup> inflorescence present but still enclosed by leaves

<sup>d</sup> 50% of open flowers on the main stem

<sup>e</sup> 50% of siliques having reached their final size

<sup>f</sup> 90% of siliques ripe

<sup>g</sup> the period from sowing till start of flowering

<sup>h</sup> the period from start of flowering till seed maturity

<sup>i</sup> the period from sowing till seed maturity (harvest)

**Table S2.** Main phenological growth stages of the seven camelina genotypes sown in spring 2017 (Y1S) and 2019 (Y2S) expressed as growing degree days (GDD) with the corresponding cumulative rainfall (mm).

| Growth period                                  | GDD (°C d)  |             |             |             |             |             |             | Cumulative rainfall (mm) |              |              |              |              |              |

Phenotypic descriptions and growth stages according to the BBCH scale [47]:

<sup>a</sup> emergence of cotyledons through soil surface

<sup>b</sup> main stem of 10% of its final length

<sup>c</sup> inflorescence present but still enclosed by leaves

<sup>d</sup> 50% of open flowers on the main stem

<sup>e</sup> 50% of siliques having reached their final size

<sup>f</sup> 90% of siliques ripe

<sup>g</sup> the period from sowing till start of flowering

<sup>h</sup> the period from start of flowering till seed maturity

<sup>i</sup> the period from sowing till seed maturity (harvest)

**Table S3.** Pearson's product-moment correlation coefficients and their *p*-values for environmental and agronomic traits of camelina.
