Linalool, α -terpineol, geraniol and geranylacetone were quantified using pure standard compounds. Cymene (m- and p-) and γ -terpinene were semi-quantified using a linalool standard. Citronellal and menthol(+isomenthol) were semi-quantified using an α -terpineol standard. All sesquiterpenoids and free norisoprenoids were semi-quantified with the internal standard β -cedrene and expressed as equivalent concentrations of the internal standard. *All monoterpenes were expressed at the $\mu\text{g}/\text{g}$ grape sample. *All sesquiterpenes and norisoprenoids were expressed at the $\mu\text{g}/\text{kg}$ grape sample. *Total free terpene compounds were expressed at the $\mu\text{g}/\text{g}$ grape sample. *ND: not detected. *Different letters in the column represent significantly different means \pm SD ($p < 0.05$). *P(film): UV attenuation effects by different films; P(stage): phenological stage effect, achieved by two-way ANOVA at $p < 0.05$.

Linalool, α -terpineol, geraniol and geranylacetone were quantified using pure standard compounds. Cymene (m- and p-) and γ -terpinene were semi-quantified using a linalool standard. Citronellal and menthol(+isomenthol) were semi-quantified using an α -terpineol standard. All sesquiterpenoids and free norisoprenoids were semi-quantified with the internal standard β -cedrene and expressed as equivalent concentrations of the internal standard. *All monoterpenes were expressed at the $\mu\text{g}/\text{g}$ grape

sample. *All sesquiterpenes and norisoprenoids were expressed at the $\mu\text{g}/\text{kg}$ grape sample. *Total free terpene compounds were expressed at the $\mu\text{g}/\text{g}$ grape sample. *ND: not detected. *Different letters in the column represent significantly different means \pm SD ($p < 0.05$). *P(film): UV attenuation effects by different films; P(stage): phenological stage effect, achieved by two-way ANOVA at $p < 0.05$.
