

Supplementary Figure 1. (a) Experimental layout in the Issapur Farm, NBPGR, New Delhi with 1232 diverse mung bean accessions, (b) accession showing mid-day wilting, and (c) accession tolerant to mid-day wilting.

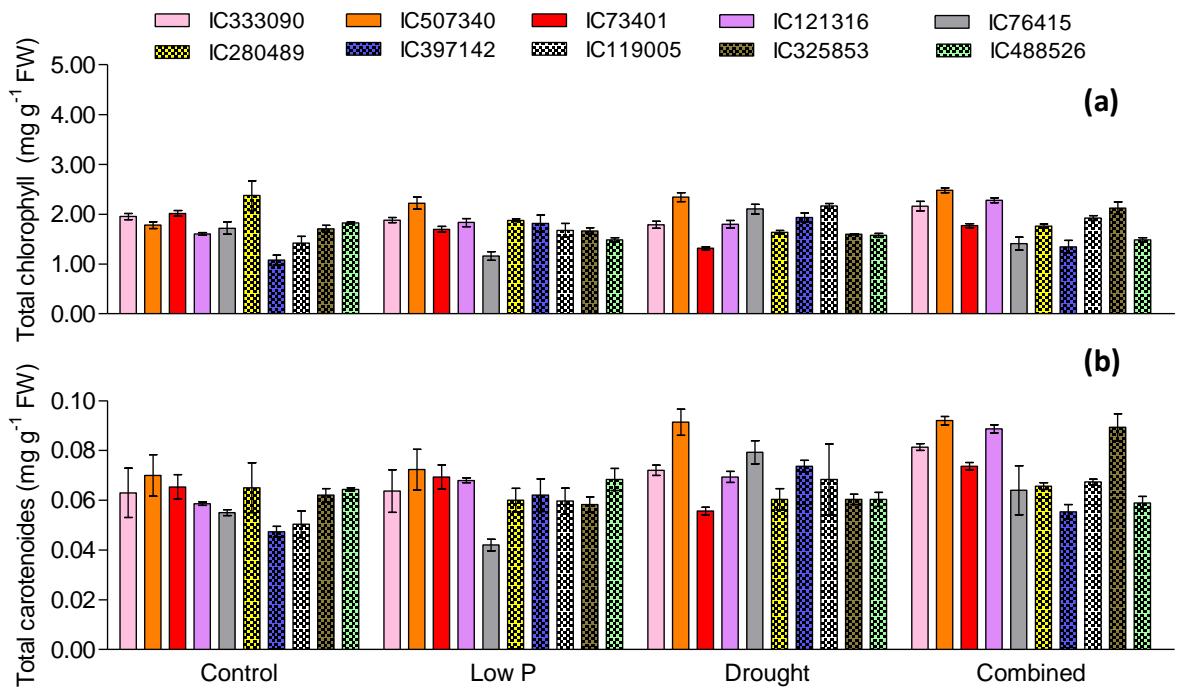

Supplementary Figure 2. Growth of mungbean seedlings in hydroponics at different phosphorus concentration to identify the optimum and low P levels. Growth traits such as (a) total chlorophyll, (b) leaf area, (c) total dry weight and (d) root-to-shoot ratio were recorded on 21 days old seedlings in two accessions, MH 421 and IPM 2-3.

Supplementary Figure 3. Variation among contrasting group of mungbean accessions with respect to (a) shoot biomass, (b) total biomass, (c) chlorophyll concentration, (d) total root length, (e) root surface area, (f) root average diameter, (g) root-to-shoot ratio, (h) total P uptake, (i) rate of water loss at control, low P, drought and combined stress conditions. Plants were grown in hydroponics. Black line (—) inside boxes indicates median, box hinges indicate first and third quartiles, and whiskers indicate full range of the data. Solid circles denote outliers according to Tukey's test.

Supplementary Figure 4. Actual performance (absolute values) of ten mungbean accessions selected from hydroponics experiment with respect to **(a)** shoot biomass, **(b)** total biomass, **(c)** chlorophyll concentration, **(d)** total root length, **(e)** root surface area, **(f)** root average diameter, **(g)** root-to-shoot ratio, **(h)** total P uptake, **(i)** rate of water loss at control, low P, drought and combined stress conditions. The tolerant (bars 1 to 6) and sensitive (bars 7 to 10) mungbean accessions were identified based on their response to different stresses as mentioned in Table 1.

Supplementary Figure 5. Effect of low P, drought and combined stress on concentration of (a) total chlorophyll, and (b) carotenoid in 10 mungbean accessions. 1-5 and 6-10 represents tolerant and sensitive accessions respectively. Error bars indicate mean \pm SEM.

Supplementary Table 1. Passport data of 100 diverse mungbean accessions grown in hydroponics culture to screen for low phosphorus and drought stress tolerance
