

Table S1. SOC, CD, HA/FA, H, HA/FA, DH contents in the topsoil layer (0-30 cm) as influenced by crop rotation, manure application and inorganic N rate in the long-term field experiment at Grabow, Poland. Treatments with the same letter are not significantly different ($P \leq 0.05$), and the comparison for mean values in crop rotation is marked with a capital letter.

The obtained results were analysed statistically by means of variance analysis (using Tukey's test) and single factor regression. Statistical calculations were performed using the program Statgraphics plus). Results are the means from 3 replications.

Crop rotation A	Manure rates ($t \cdot ha^{-1}$)	Nitrogen fertilization ($kg \cdot ha^{-1}$)	Soil organic (SOC) %	Carbon solution (CD) %	Humic acids (HA) %	Fulvic acids (FA) %	Humin s (H) %	HA/FA the ratio	The degree of humification (DH)
