

Lignin–Chitosan Nanocarriers for the Delivery of Bioactive Natural Products against Wood-Degrading Phytopathogens

E. Sánchez-Hernández, N. Langa-Lomba, V. González-García, J. Casanova-Gascón, J. Martín-Gil, A. Santiago-Aliste, S. Torres-Sánchez and P. Martín-Ramos

SUPPLEMENTARY MATERIALS

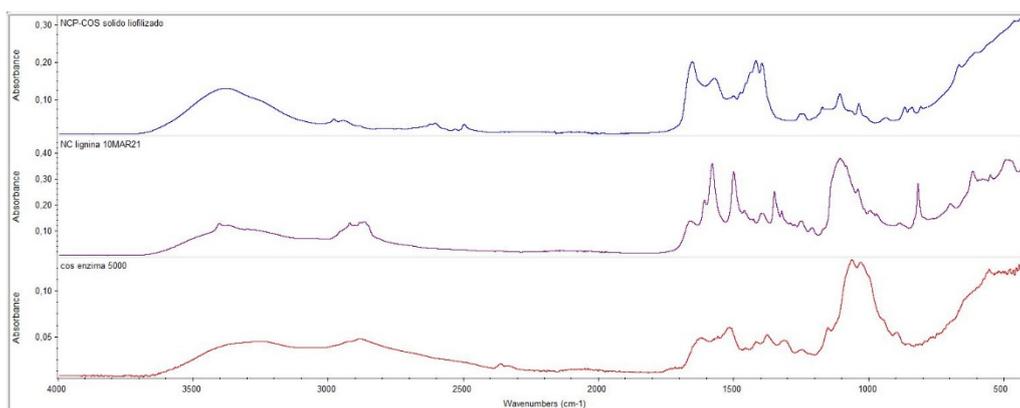

Figure S1. Comparison of the ATR-FTIR spectra of the ML–COS nanocarriers (*top*); lignin NCs with synthetic amine crosslinking prepared according to the procedure reported by Fischer *et al.* (2019) (*center*); and enzymatically obtained chitosan oligomers (*bottom*).

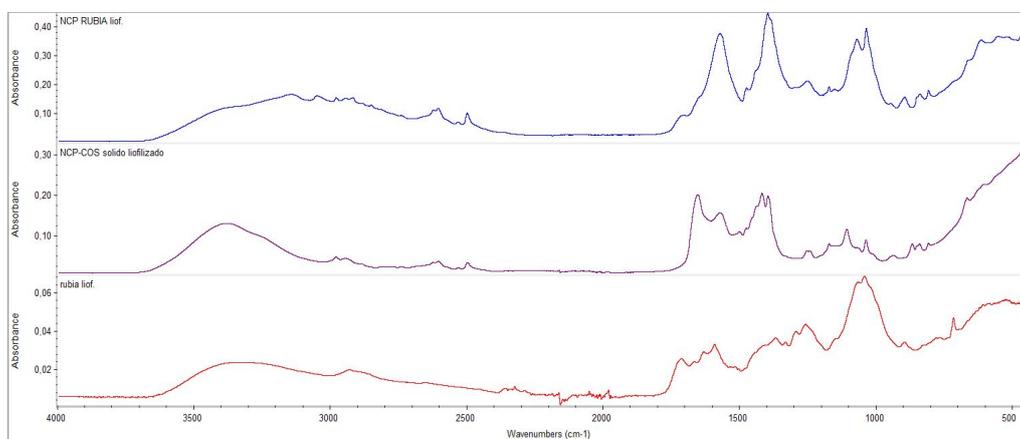

Figure S2. Comparison of the ATR-FTIR spectra of the ML–COS NCs loaded with *R. tinctorum* extract (*top*), ML–COS NCs with no encapsulated product (*center*), and the lyophilized *R. tinctorum* extract (*bottom*).

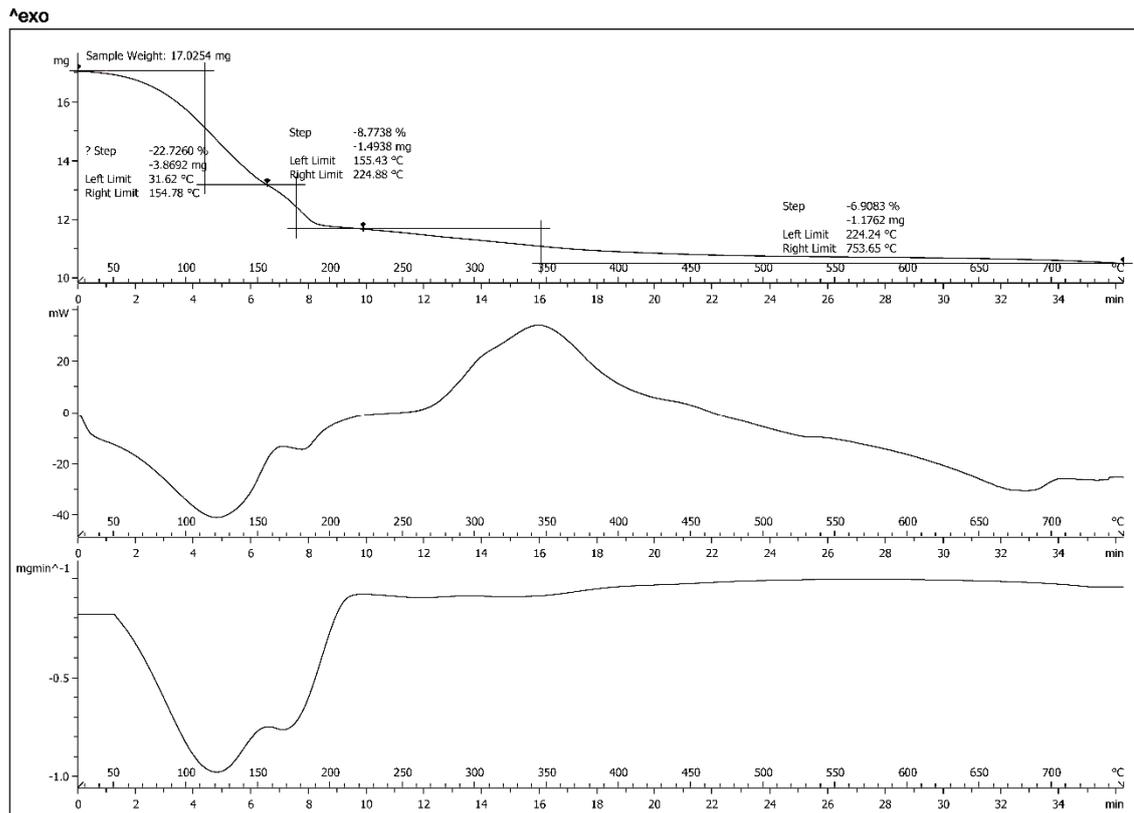

Figure S3. Thermal analysis of the ML-COS nanocarriers: TG (*top*), DTG (*center*) and DSC (*bottom*) curves.

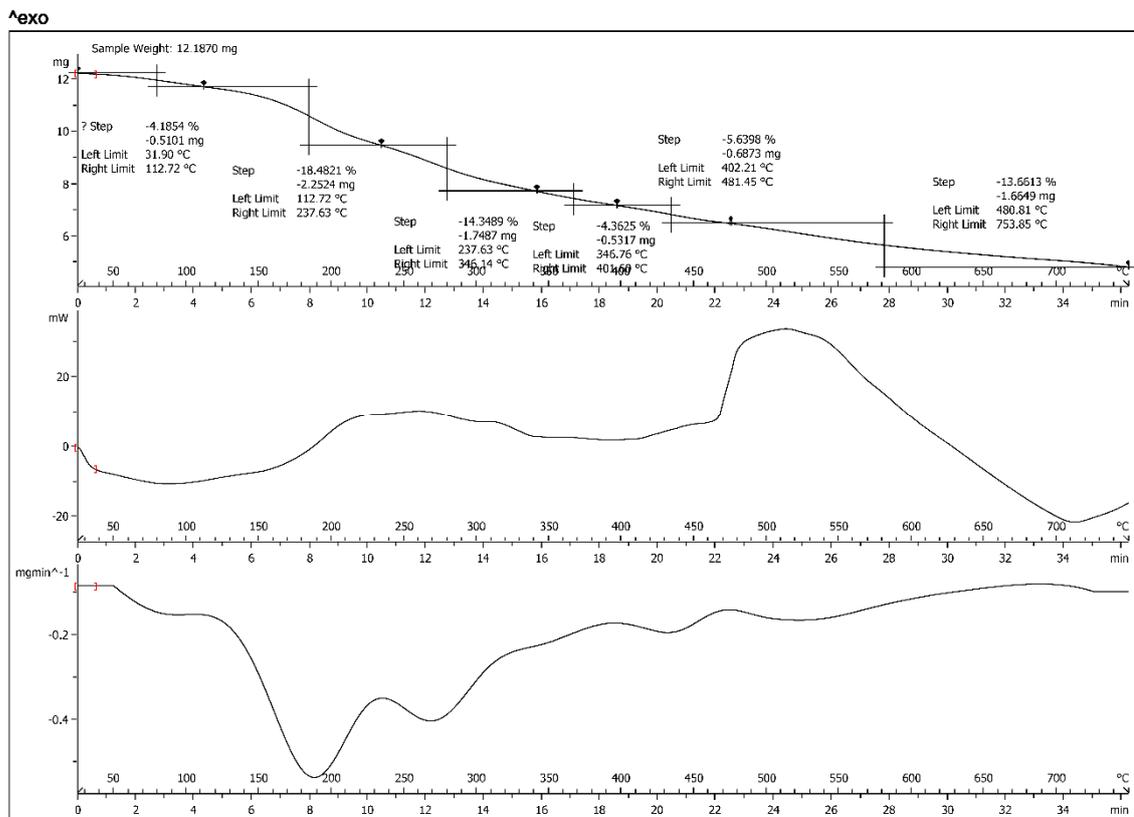

Figure S4. Thermal analysis of ML-diamine-ML nanocarriers prepared according to the procedure reported by Fischer *et al.* [1]: TG (*top*), DTG (*center*) and DSC (*bottom*) curves.

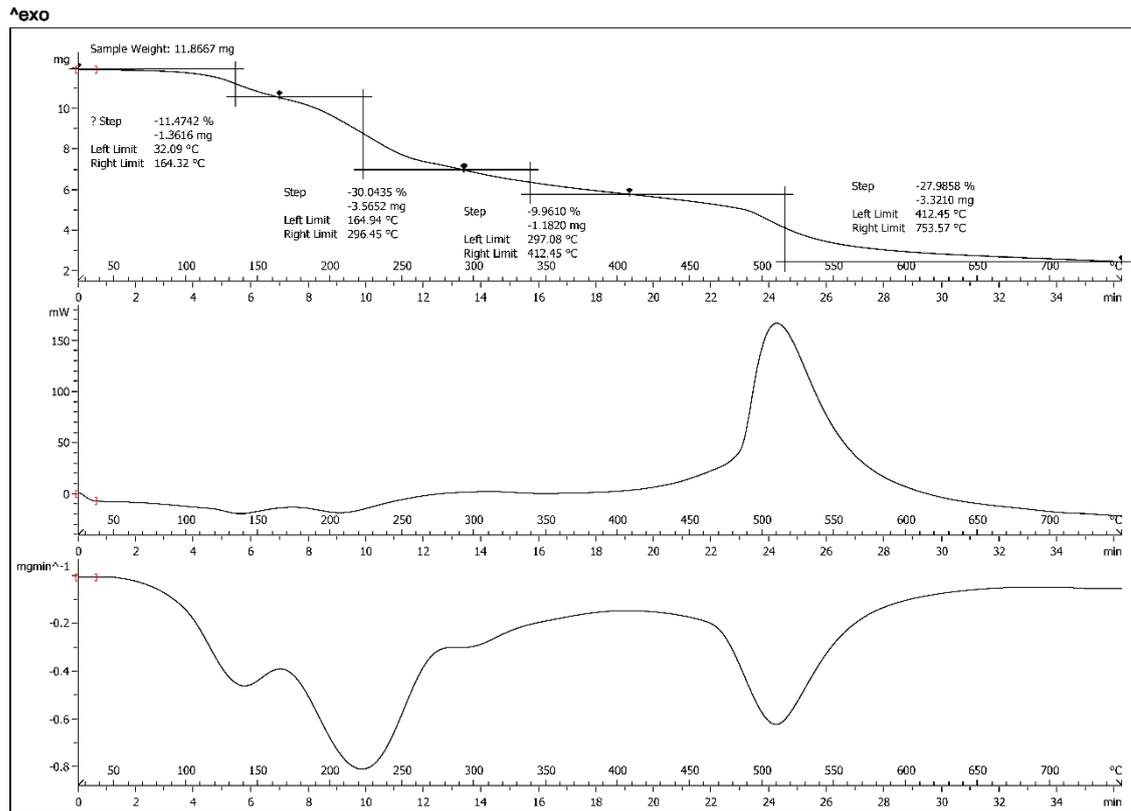

Figure S5. Thermal analysis of the ML-COS nanocarriers loaded with *R. tinctorum* extracts: TG (top), DTG (center) and DSC (bottom) curves.

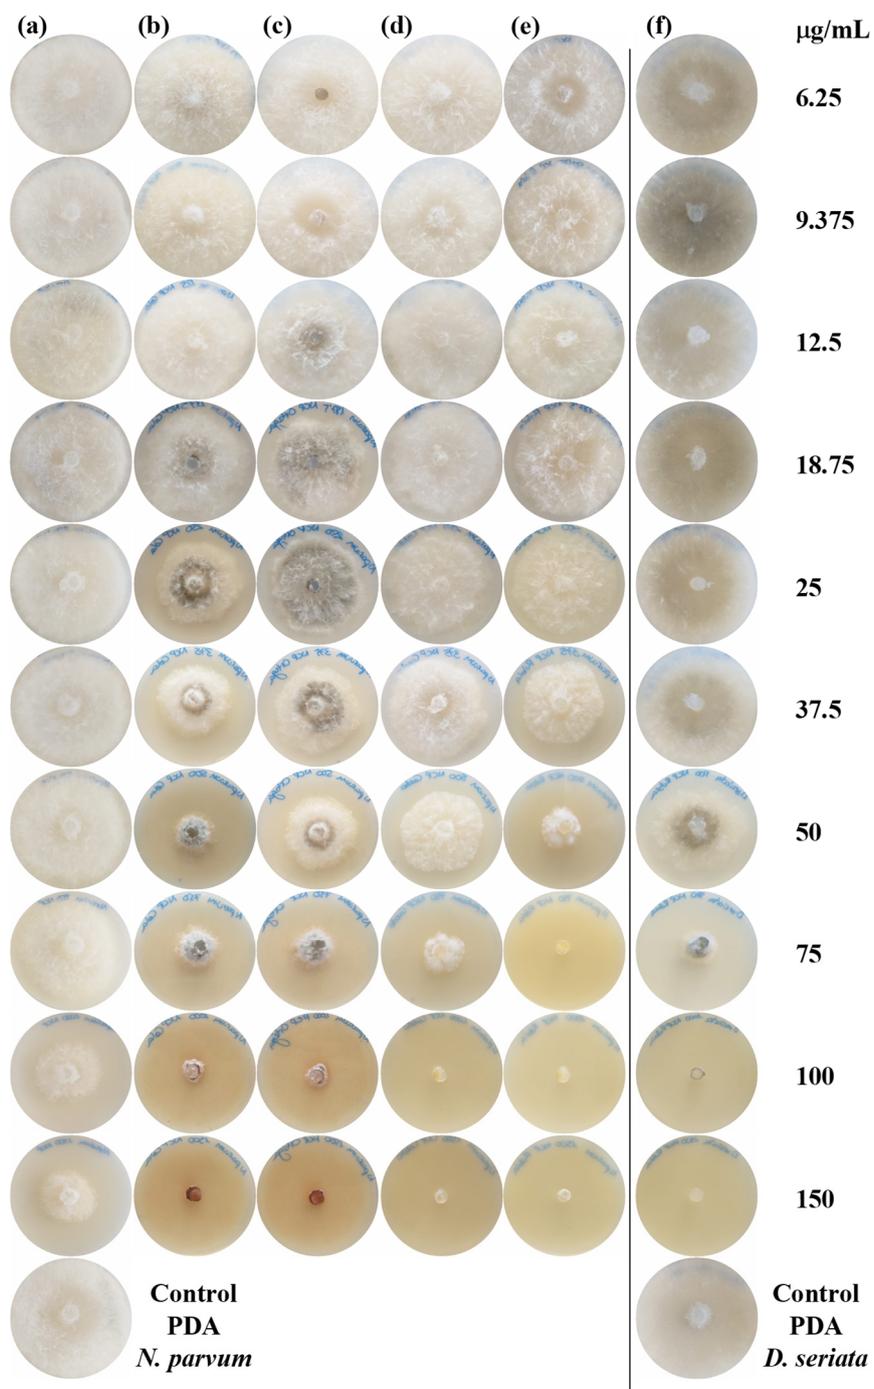

Figure S6. Effect of ML-COS NCS-based treatments at different concentrations (6.25; 9.375; 12.5; 18.75; 25; 37.5; 50; 75; 100; 150 $\mu\text{g}\cdot\text{mL}^{-1}$) on the growth of *N. parvum*: (a) ML-COS; (b) ML-COS-*E. arvensis*; (c) ML-COS-*U. dioica*; (d) ML-COS-*S. marianum*; (e) ML-COS-*R. tinctorum*; and on the growth of *D. seriata*: (f) ML-COS-*R. tinctorum*.
