BUSCO Assessment Results

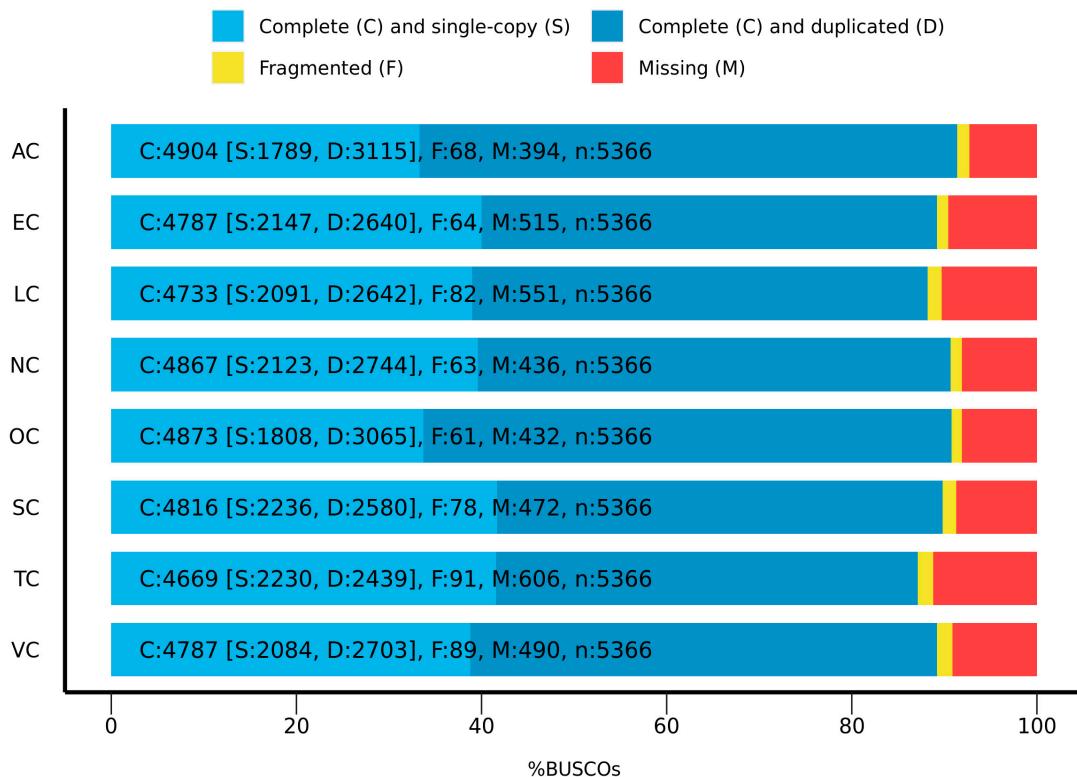

Figure S1. BUSCO summary results of the eight assembled transcriptomes. Alp (*Lens culinaris* ssp *culinaris*, cv Alpo), Ori (*L. orientalis*), Tom (*L. tomentosus*), Erv (*L. ervoides*), Lam (*L. lamotei*), Nig (*L. nigricans*), and two *L. odemensis* (Ode1 and Ode2).

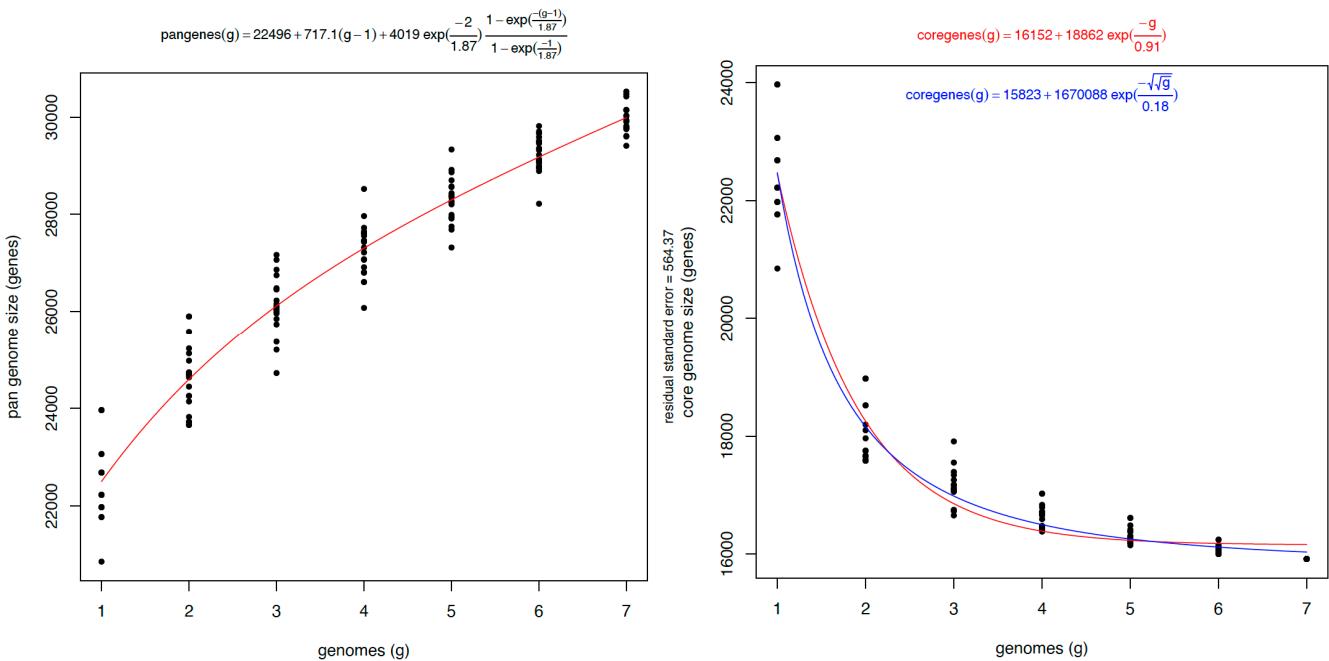

Figure S2. Pan-transcriptome simulations modelling the growth of the lentil pan-transcriptome by adding expressed CDS from 7 accessions. DNA-based non-redundant pan-transcriptome size estimates (A) and core transcriptome size (B) based on random samples of 7 transcriptome sets. Simulations was done with all non-redundant clusters. Plots summarize the results of 20 permutations in which input transcriptomes were randomly sorted and added to the pool.

Supplementary Table S2	Percentage of conserved sequence clusters shared by pairs of species.
