Supplementary Table S2. Photosynthetic rate (A), transpiration rate (E), stomatal conductance (gs), extrinsic water use efficiency (WUEe) and intrinsic water use efficiency (WUEi) measured for the best nine purple passion fruit genotypes *Passiflora edulis* Sims f. *edulis*, from the Bogotá Universidad Nacional (BBFV) series grown in two production locations: Pasca and Susacón at different elevations in meters above sea level (m a.s.l). Total genotypes included 34 landraces, 8 commercial cultivars and 8 genebank accessions. Asterisks indicated the best genotypes for gas exchange.

Genotypes	Pasca (1800 m a.s.l)					Susacón (2500 m a.s.l)

Supplementary Table S3. Derived parameters for photosynthetic light response in the best ten genotypes of purple passion fruit, *Passiflora edulis* Sims f. *edulis*, grown in two production locations, Pasca and Susacón at different meters above sea level (m a.s.l). The traits, \pm standard deviation, included A_{\max} = maximum photosynthesis rate, PAR_{sat} = photosynthetically active radiation at saturation of light, R_d = rate of dark respiration, I_c = point of light compensation, ϕ = apparent quantum yield based on the number of photons absorbed to fix one mole of CO_2 . Total genotypes included 34 landraces, 8 commercial cultivars and 8 genebank accessions. Asterisks indicated maximum values obtained for each parameter found in the best ten genotypes with the averages for each group of genotypes (landraces, commercial cultivars and genebank accessions).
