

Table S1. Caudal striatum (cSTR) cytokine level summary statistics stratified by rat model WT vs. HIV-1_{Tg}. Student's t-tests with unequal variance were used to compare the difference in mean expression levels (and SD) of each cytokine, chemokine, or growth factor in WT (saline-yoked ($n = 7$) and cocaine SA ($n = 8$)) and HIV-1_{Tg} (saline-yoked ($n = 6$) and cocaine SA ($n = 6$)) in the cSTR. The 95% CI, overall p value and cumulative replicates are given in the table. Bold cytokines, chemokines, or growth factors indicate targets that were significantly increased in HIV-1_{Tg} rats compared to WT.

Cytokine (log ₂ Transformed)	WT					HIV-1 _{Tg}				
	Saline	Cocaine	Adjusted p-value			Saline	Cocaine	Adjusted p-value		
			95% CI	p-value	(Bonferroni)			95% CI	p-value	(Bonferroni)
G-CSF	0.44 (0.81)	0.09 (0.63)	[−0.595, 1.29]	0.428	0.430	0.34 (0.70)	0.46 (0.45)	[−0.811, 0.574]	0.711	0.710

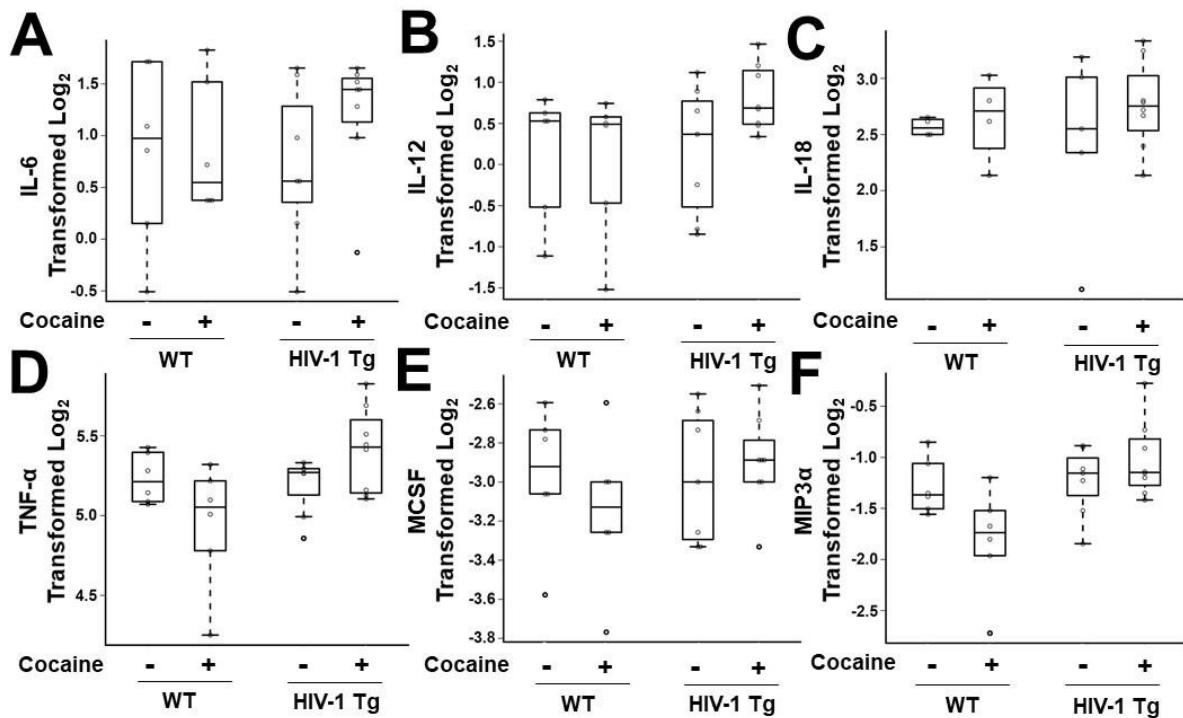

Figure S1. Cytokines with no significant difference in the fCTX of WT and HIV-1^{Tg} rats. FCTX brain tissue was collected, and equivalent total protein lysates were assayed for cytokine levels from F344 saline-yoked ($n=6$), F344 cocaine SA ($n=6$), HIV-1^{Tg} saline-yoked ($n=7$), and HIV-1^{Tg} cocaine SA ($n=8$) male rats. Protein levels for IL-6 (A), IL-12 (B), IL-18 (C), TNF- α (D), MCSF (E), and MIP3 α (F) are shown. Log2 transformation was performed prior to statistical analyses since some expression levels were not normally distributed. All tests were conducted in R (version 3.6.1).
