

Supplementary methods:

An exploratory analysis approach on subgroups within the cohort was performed in which participants were classified according to both the occurrence of NPS (NPI-Q > 0) and the presence of cerebral AD pathology (CSF p-tau181/A β 1–42 ratio > 0.0779). Given the small sample size of NP-/AD+ participants we could not fit neither a binomial regression nor an Elastic model on the available data. Both models were greatly overfit which was expected considering how the number of variables surpasses the number of samples. As a result, we explored the data with Mann–Whitney U test looking at the concentration of CSF proteins between with or without NPS in AD- participants or in AD+ participants. These tests did not uncover any further differentially expressed proteins but only identified a subset of the proteins that were different between groups as shown below (**Supplementary Materials Table S7**). These results are difficult to interpret since only 15 participants presenting NPS are included in the AD- group and in the AD+ only 7 participants do not have NPS. This suggests that while there is some interaction between AD and NPS, the proteins identified in association with NPS are largely independent of the presence of AD, further confirming results observed in the whole cohort in models considering AD status as a covariate.

790 proteins investigated in this study

Supplementary Materials Table S7: Proteins differentially expressed in participants with or without NPS in participants without AD (left) or presenting cerebral AD (right). Numbers represent participants without NPS/participants with NPS (NPI-Q > 0).

	NPI-Q total score	NPI-Q depression	NPI-Q apathy	NPI-Q anxiety
mean	5.74	0.56	0.64	1.05
median	4	0	0	1
range	1-26	0-3	0-3	0-3

Supplementary Materials Table S8: Mean, median and range for the NPI-Q total score and for depression, apathy and anxiety domains.
