

Figure S3. Association of rs2046210 genotypes with the survival of human breast cancer patients. Kaplan-Meier analyses of the overall survival, disease-free survival and metastasis-free survival in unselected patients (top row; $n=134$), estrogen receptor (ER) positive patients (second row; $n=76$), ER negative patients (third row; $n=55$), and luminal A patients (bottom row; $n=63$) are shown. Numbers (n) of patients in each group and p -values (p) determined by log-rank tests are indicated.
