**Figure S1.** Mto1p co-enrich with Myp2p without perfect colocalization. Timelapse micrographs of a cell expressing Mto1p-GFP and mCherry-Myp2p imaged in a yeast motel. Dashed circle, cell outline. Micrographs are inverted grayscale LUT, except merged color images.

**Figure S2.** Ase1p accumulates with microtubules in the contractile ring and Mal3p labels the +tip/distal ends of the IPAA microtubules. **(A)** Timelapse micrographs of cell expressing Mal3p-mEGFP, Cut11p-tdTomato and Rlc1p-tdTomato. Arrowheads point to the tip of a dynamic IPAA microtubule +tip. Arrows point to other IPAA microtubule +tips in the cell. **(B)** Timelapse micrographs of cell expressing GFP-Atb2p and Ase1p-mCherry. Dashed outlines, cells. Micrographs are shown as inverted grayscale LUT except merged color images.

**Figure S3.** Probing the mechanical properties of the contractile ring by laser ablation. Diagram of the method of laser ablation of contractile rings (modified from [15]).

**Figure S4.** Interphase nucleus in  $\Delta mto1$  cells show exaggerated motions and a lemon shape. Timelapse micrographs of cells expressing GFP-Atb2p, Sad1p-mEGFP, and Cut11p-tdTomato in wild-type,  $\Delta mto1$ , and  $mto1-427$  cells to show differences in nuclear shape and movements. Arrowheads, typical transient deformations in nuclear envelope caused by forces exerted by microtubules. Dashed outline, cells. All micrographs are shown as inverted grayscale LUT.
