

Fig. S1

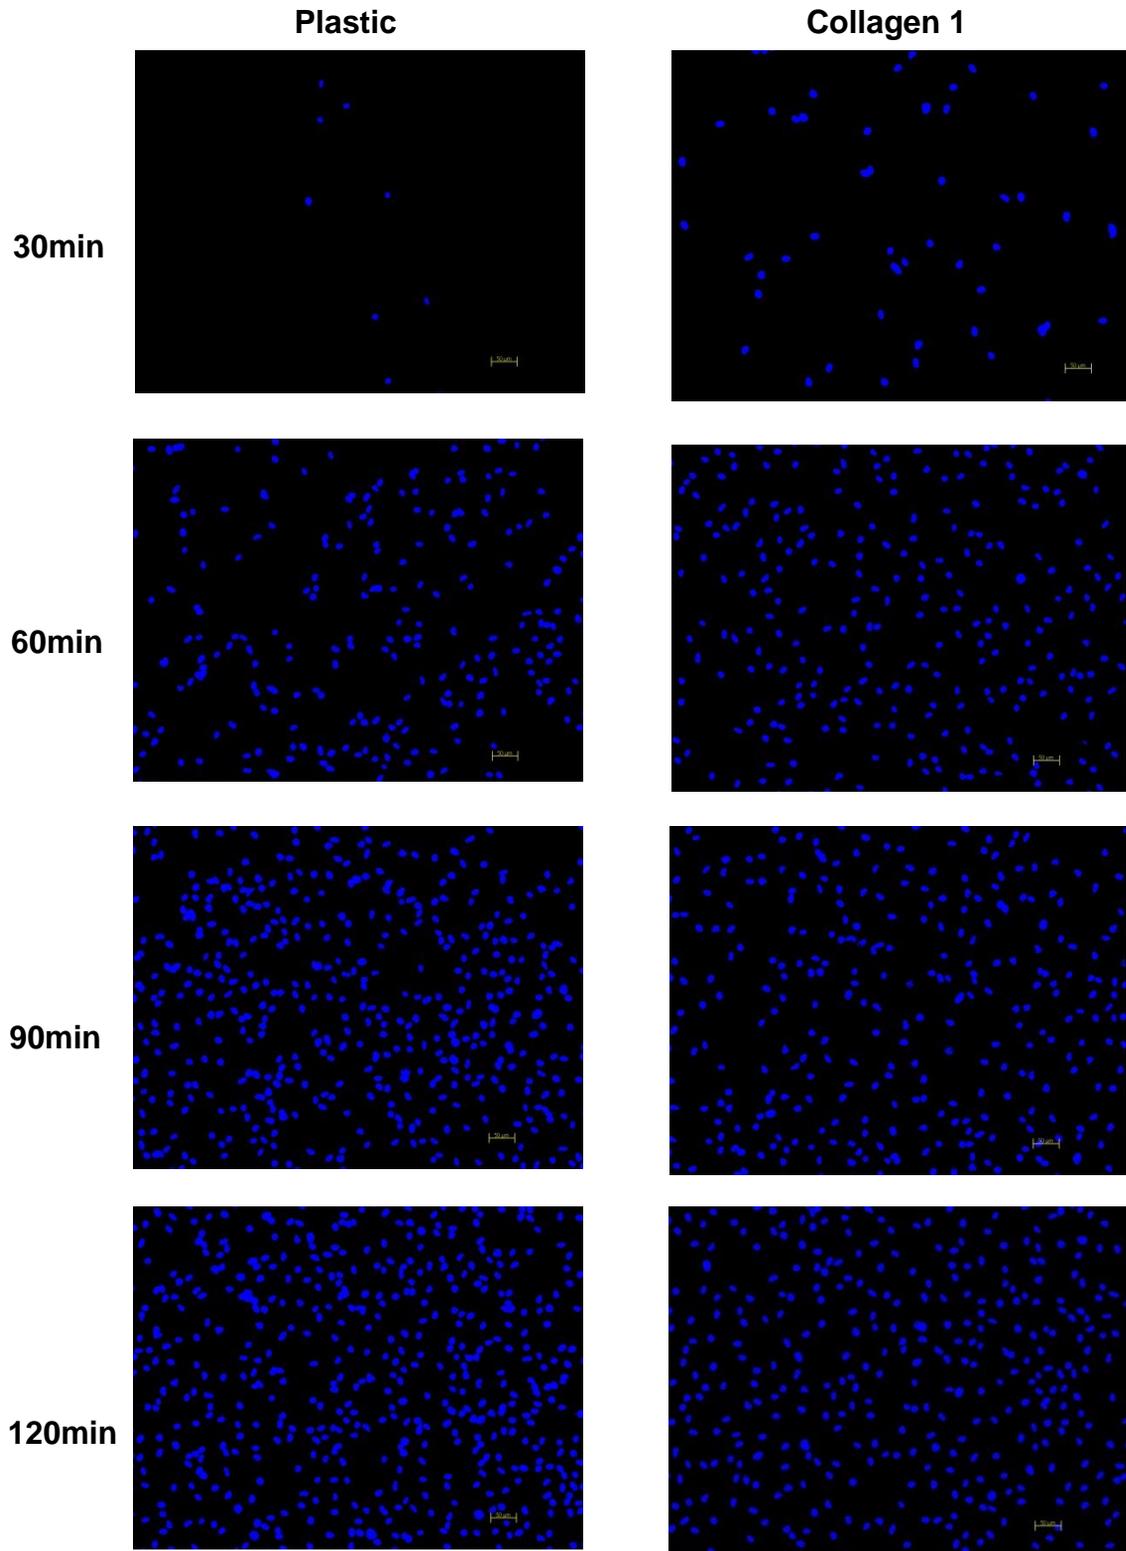

Fig. S1: Time-dependent cell adhesion of ASCs to plastic vs collagen I. ASCs were plated at a density of 1×10^4 cells per well into microtiterplates either non-coated or coated with collagen I. After 30, 60, 90 and 120 min non-adherent cells were discarded and the remaining cells were stained with bisbenzimidazole. The photographs show representative sections
