

Supporting Information Table1. List of Primers

Primers for quantitative RT-PCR were designed using Primer-Blast on GenBank sequences and are separated by at least one intron or span an exon-exon junction for intron containing genes.

Gene	GenBank sequences	Forward (5'-3')	Reverse (5'-3')

129/Ola

Supplementary Figure 1

Supplementary Figure 1. Loss of LSEC fenestration in *Bmp9*-KO mice in the 129/Ola background

A. Quantification of fenestrae by Scanning Electron Microscopy (SEM) of WT mice in the 129/Ola genetic background 6 hours after freshly isolated LSEC plating. Results were analyzed using Mann-Whitney statistical analysis * $p < 0.05$.

B. Representative picture of SEM on freshly isolated LSEC from 129/Ola WT mice (females of 26 weeks old) 6 hours after plating.
