

Supplementary figures

Supplementary figure 1. Quantification of Fat blot signals. Signal quantification from figures 1E and 5C were made by ImageJ software. The bars indicate the average and standard deviation (n = 2). Fat blot densitometry analysis from A) correspond to WT fibrillar, B) for R34A mutant and C) for R45A mutant

Supplementary figure 2. Evaluation of the ribonuclease activity of fibrillar. The rRNA degradation activity of fibrillar was tested for 45 min at three different temperatures (4, 25 and 37°C) (A). It is noted that at 4°C the rRNA degradation is minimal with only one 3000 pb RNA fragment degraded (lane 3). At 25 and 37°C additional degradation of the rRNA was observed (lanes 5 and 7). Of note, DNA derived from RNA extraction remains intact. Time dependent activity was also evaluated at 15, 30 and 45 min at 37 °C (B).

Supplementary figure 3. Ribonuclease activity assay of fibrillarlin in the RNP complex or fibrillarlin alone in the presence of different phosphoinositides. The activity of RNP complex was evaluated for 45 min at 37°C in presence of PIP3, PI4P, PI5P, and PI35P at a final amount of 5 ng (A). The ribonuclease activity of fibrillarlin alone was measured for 45 min at 37 °C in the presence of (B) PI3P and (C) PI5P.

Supplementary figure 4. A) SIM image of SNAP FIB and Immunolocalize PIP2. ROI line were drawn across the fibrillarin rings and quantified as shown in B and Graph according to the intensity of the pixel

Supplementary figure 5. *SIM images taken along Z stack with 0.125 μ M.* SNAP-fibrillarin is in green and anti PIP2 is shown in red. The inset from the first row of figures was magnified and showed each channel or merged as pointed in the figure.

Supplementary figure 6. Co-localization of GFP and SNAP tagged Fibrillarin. Stable cell culture expressing SNAP-Fibrillarin (red). The stable cell line was transiently transfected with wild type GFP-Fibrillarin (green) on top and mutant GFP-Fibrillarin (K131E, A250P) in the lower row.

Fibrillarin mutagenesis

Mutagenesis was performed with Phusion Hot Start II DNA Polymerase and the PCR product processed DpnI, kinase and ligase enzymes using specific primers for each mutation. The vector pGFP-Fibrillarin was used as DNA template for the first mutagenesis cycle and confirmed by sequencing. For the second mutation, the sequence confirmed of mutant K131E was used as template for the A250P mutation. Primers used for K131E mutant are the following: Fw 5'-AGGAGATGACGAAATTGAGTACC-3' and Rv 5'-TCCGAAATCGAGACTCTC-3'. Their transient transfection in Fibrillarin-SNAP stable cell line was performed at 80% confluence using polyethylenimine (PEI) with 10 µg of fibrillarin-mutant K131E, A250P-GFP plasmid 1 ml of DMEM (Dulbecco's Modified Eagle's Medium) without fetal calf serum. Transfection cocktail were vortexed and incubated 5 min at RT, added dropwise to the cell culture. The fluorescent substrate used for this work was SNAP-Cell® TMR-Star (555 nm) is a red fluorescent substrate added by dropwise in the culture media and washed after 5 min to stain the fibrillarin with SNAP tag. After 48 hr of incubation after transient transfection the TMR-Star (555 nm) was added and the cells were fixed in 4% with formaldehyde solution in PBS for 15 min and washed once in PBS and analyzed by microscopy. Images were acquired with a DM6000B fluorescent microscope, the illumination with Leica EL6000 with HXP 120W / 45C VIS Hg lamp for fluorescent lamp for transmitted light. Using a 555nm channel for SNAP tag, 488 for GFP tag.

Supplementary figure 7. Co-localization of immunolocalization fibrillarin and SNAP tagged Fibrillarin. Stable cell culture expressing SNAP-Fibrillarin (red) and immunolocalize fibrillarin in green. Black and white slides only show a specific channel. 488 nm for anti-fibrillarin and 555 nm for the SNAP-Fibrillarin. The Inset shows a typical nucleolus of the cell

Methodology for figure 7

Snap-fibrillarin cells were feed for half an hour with SNAP-Cell® TMR-Star then wash with PBS, fixed, permeabilized and immunotreated as previously publish (25). We used rabbit polyclonal anti-Fib antibody (H-140, Santa Cruz Biotechnology, Dallas, TX, USA), secondary anti-rabbit polyclonal IgG Cat # A-21206 Alexa Fluor® 488, Invitrogen

Structured illumination microscopy images were acquired using the 3D-SIM system DeltaVision OMX (GE Healthcare Life Sciences, Marlborough, MA, USA) with PLAN APO N 60x/1.42 OIL objective, 4x pco.edge 5.5 sCMOS camera and DeltaVision OMX (Buckinghamshire, UK) controlling software. Lasers with wavelengths 405 nm, 488 nm, 568 nm, and 642 nm with filters for DAPI (Ex: 395.5/29; Em: 435.5/31), FITC (Ex: 477/32; Em: 528/48), Alexa Fluor 568 (Ex: 571/19; Em: 609/37). Immersion oil laser liquid (Cargille Laboratories, Cedar Grove, NJ, USA; Code: 5610; $n = 1.5160$). Image reconstruction and registration was processed with DeltaVision softWoRx 6.5.2. Software. Wiener filters were set to 0.001. Samples were mounted to 90% glycerol -supplemented with 5% N-propyl gallate.

A

B

Supplementary figure 8. SIM images of Snap-Fibrillarin, PA and PI4P during interphase. A) SNAP-fibrillarin cell line fix and probed with spo20 to localize PA or in B) with anti-PI4P antibody. The inset of the figures show is magnified below. The fluorescent substrate used for this work was SNAP-Cell® Oregon Green®. Specific primary anti-PIP2 from Echelon™ (Z-A045) was used for immunofluorescence detection of PIP2 and labeled by anti-mouse IgM secondary antibody conjugated with Alexa Flour® 555 from Life Sciences. The PA sensor Spo20p-GFP was described previously [39].

Supplementary figure 9. GMSA of fibrillarin in complex with snoRNA guides. Shift mobility gel assay of U3 snoRNA guide was evaluated with the presence of fibrillarin in (A) and another snoRNA from Archaea (C). The secondary structure of archaeal snoRNA guide is depicted in (B). Mobility shifts, highlighted by the red and dashed yellow lines, are observed in our *in vitro* assays in presence of three distinct phosphoinositides (D), implying that conformational changes could occur in presence of RNA, lipids and fibrillarin, lanes 5 to 7 in regard to lane 2 and 3.

Supplementary figure 10. Flow diagram of sequences analyzed by bioinformatics tools. Bioinformatic analysis of the different sequences and domains evaluated in the work are presented as a flow chart with the different strategies used.

Supplementary figure 11. GAR domain amino acid alignment. The sequence alignment of the basal GAR group, group A1, group A2 and group B showing two conserved arginine: R34 and R45 are represented in the figure.

Supplementary figure 12. Phylogenetic analysis of the GAR domain branches founded in the proteomes of different species. Diagram showing the two branches from the HMM analysis of GAR1 protein sequences indicated by RGG-box1 and RGG-box2.

Supplementary figure 13. Boxshade of the *Lms14-A* protein sequences. The figure shows two distinct GAR boxes in the *Lsm14-A* sequences analyzed, indicated by arrows. The alignment consists in 23 *LSM14-A* proteins of vertebrate species containing two R/G rich regions characteristic of the non-conserved GAR domain structure of some nucleoli proteins. Green square corresponds to the *LSM14* domain (Scd-like Sm domain), blue square corresponds to the FDF domain, red squares correspond to the GAR domain, and Red dashed square correspond to the section of GAR domain of fibrillarin from vertebrate species. The HMM-logo of GAR domain was constructed from the alignment of the GAR domains from the FIB retrieved proteins in chordate species.

Table S1

Table S1. List of chordate species and thier proteome files used in the analyses of GAR domain (Fibrillarin and GAR1 proteins).
Date of retrieved proteomes: July 28th, 2016.

Table S2

Table S2. List of fibrillarin protein sequences retrieved from 36 complete genomes of vertebrate species and a yeast (*S. cerevisiae*).

*The FIB sequences were retrieved from the listed genomes in S1 Table (a), using a HMM model build from an alignment of 250 FIB sequences recovered from the NCBI database by PSI-BLAST, against RefProteins of chordate species (taxid 7711) with 3 iterations.
