

Supplementary Results

We identified a single *cry* gene in *Onchidium*. Phylogenetic analysis showed that it can be classified CRY1 group (Figure S1), which led us to identify it as *Onchidium* CRY1 (MK801137), and named the gene as *cry1*.

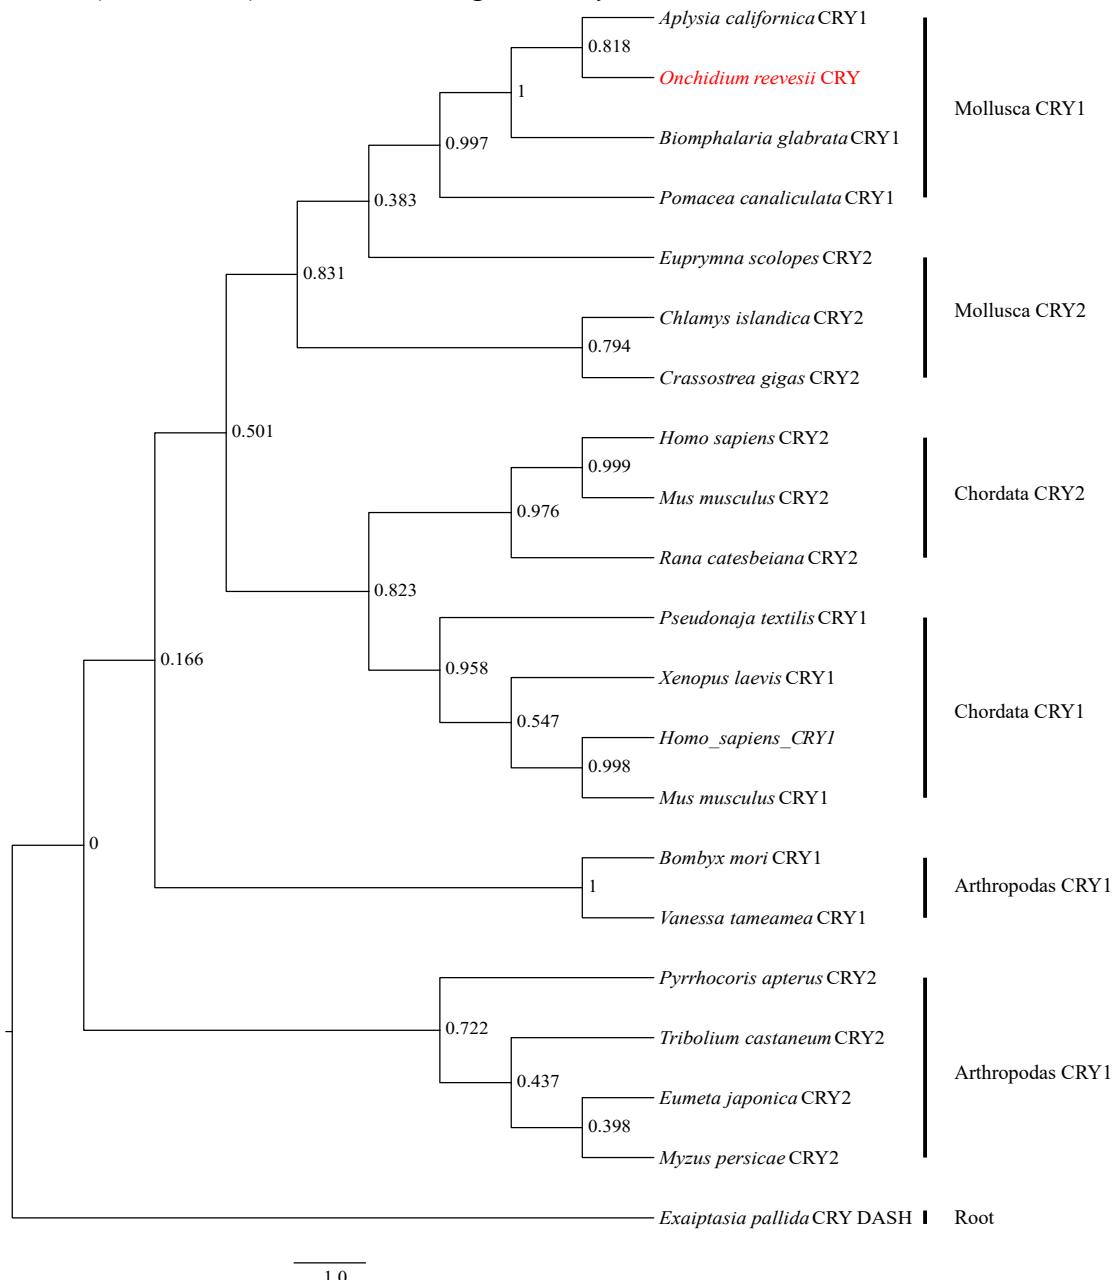

Figure S1 Phylogenetic tree of CRY family proteins.

Onchidium CRY sequences (CRY1 in present study) and other related sequences obtained from NCBI database (accession nos. are shown in Table S1) were analyzed using the maximum likelihood method (The number of bootstrap replications is 1000). The putative *Onchidium* CRY was closely related to orthologs in Mollusca CRY1 group. The tree was rooted on CRY DASH from the *Exaiptasia pallida*. The numbers at branches indicate the bootstrap values. Accession numbers for these proteins can be found in Table S1.

A single transcript for period gene was identified in *Onchidium*. Phylogenetic analysis showed that it can be classified PREIOD2 group (Figure S3), which led us to identify it as *Onchidium* PERIOD2 (MK801138).

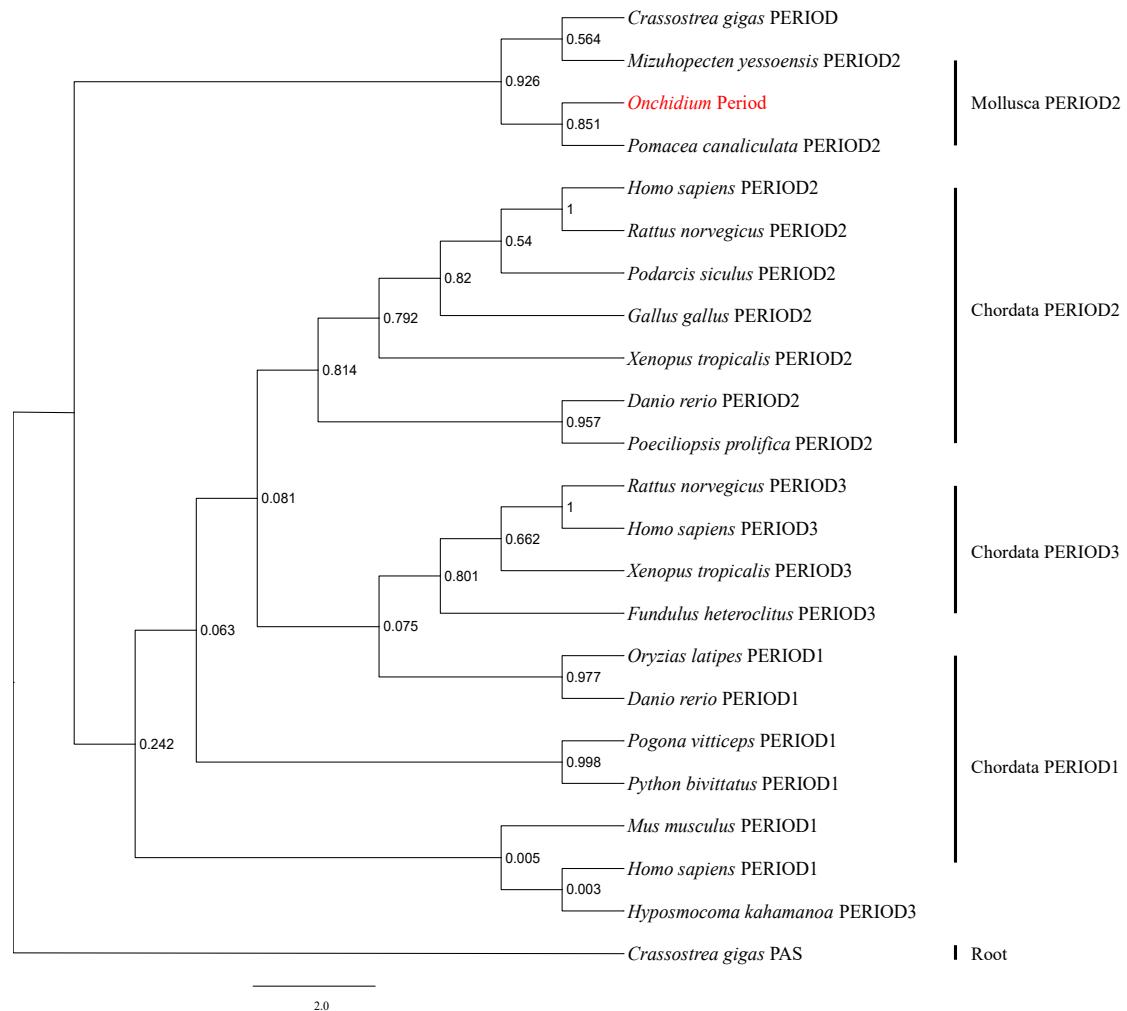

Figure S2 Phylogenetic tree of PERIOD family proteins.

Onchidium PERIOD sequences (PERIOD2 in present study) and other related sequences obtained from NCBI database (accession nos. are shown in Table S1) were analyzed using the maximum likelihood method (The number of bootstrap replications is 1000). The putative *Onchidium* PERIOD was closely related to orthologs in Mollusca PERIOD2 group. The tree was rooted on PAS DOMAIN PROTEIN (PAS) from the oyster *Crassostrea gigas*. The numbers at branches indicate the bootstrap values. Accession numbers for these proteins can be found in Table S1.

Table S1 Accession numbers for related proteins

Accession Number	Description	Species	Protein
XP_012941094.1	PREDICTED: cryptochrome-1-like	<i>Aplysia californica</i>	<i>Aplysia californica</i> CRY1
