### S1. Odds ratio (OR) test on GO annotations

To analysis the distribution of composite gene in eukaryotes and prokaryotes, apart from the COG annotations, we carried out the Odds ratio (OR) test on GO annotations as well. The results were collected from EggNOG output. Analysis is similar to COG analysis, for both eukaryotes and prokaryotes genes, counted the frequency of each function, OR value, upper and lower confidential interval (CI) values with conservative Bonferroni correction. Composite genes acted as cellular components and involved in biological process are statistical more likely to be from eukaryotes but genes in molecular function did not show much difference between eukaryotes and prokaryotes. The detailed information is showing in S1.

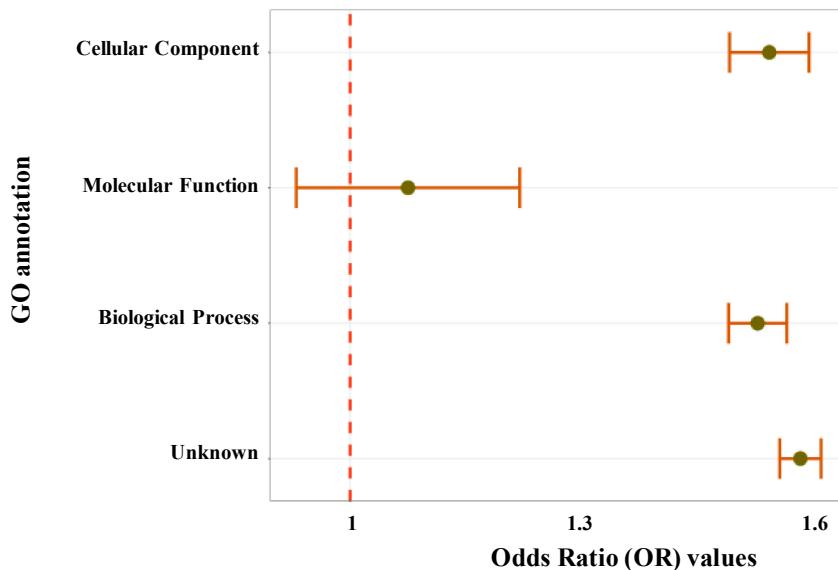

Figure S1. Numbers of OR, corrected upper 95% CI and lower 95% CI value across all GO annotations.

Table S1. Numbers of composite and non-composite genes from eukaryotes and prokaryotes in different functional categories, OR, corrected upper and lower 95% CI values.

Functional annotations	Composite		Non-composite		OR	Corrected lower 95% CI	Corrected upper 95% CI
	Eukaryotes (a)	Prokaryotes (c)	Eukaryotes (b)	Prokaryotes (d)
