

Figure S3. Volcano plot representing the result of hypothesis testing between lesional and non-lesional samples. The vertical axis corresponds to 1 - adjusted p-value, and the horizontal axis displays the log base 2 fold change values between two groups. The red line shows where (1 - adjusted p-value) = 0.01 with points above the red line having adjusted p-value < 0.01. Each point on the plot indicates the statistical result for a single gene.
