

Figure S1. Map showing the geographic distribution of the wild populations of *Ipheion uniflorum* used in this study (green dots) and natural distribution of the species (orange dots). N: North; C: Centre; S: South.

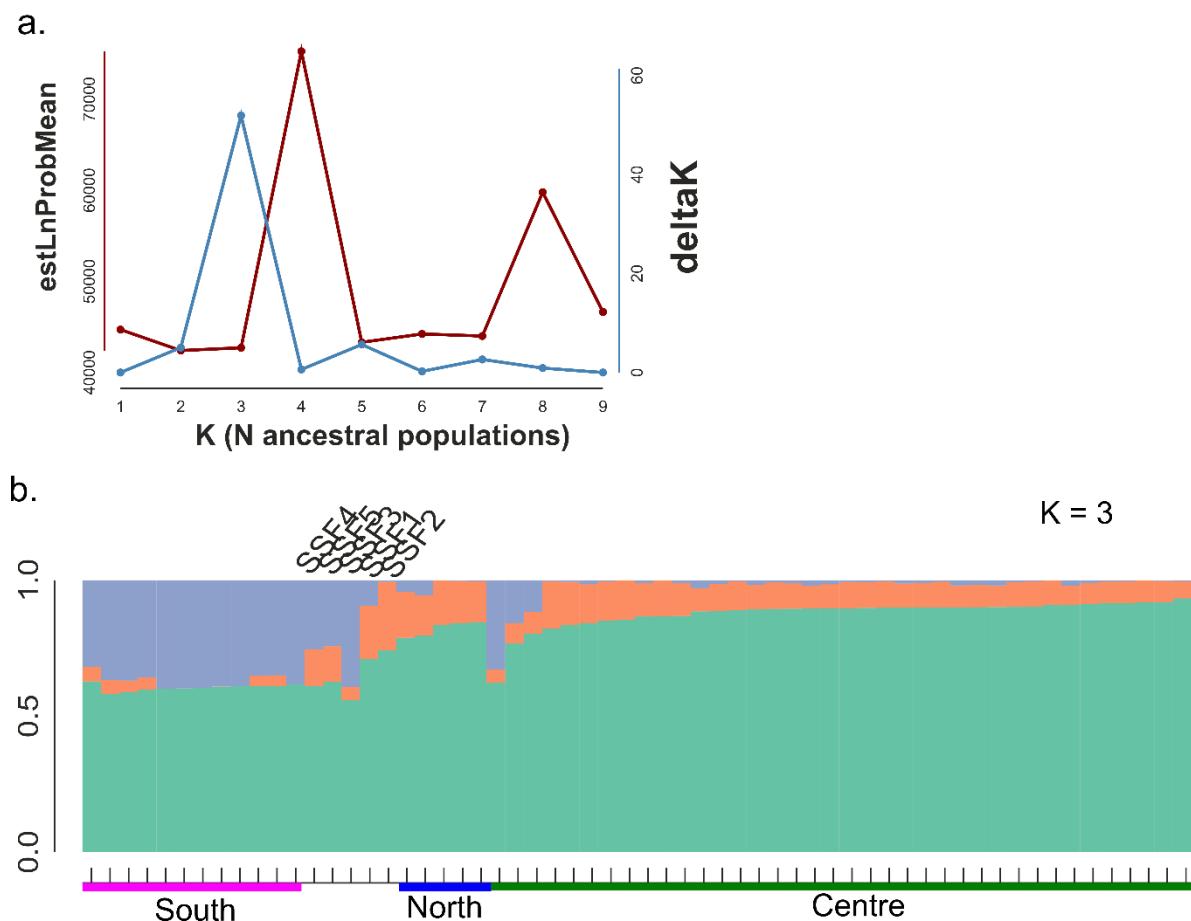

Figure S2. Population structure analysis. (a) Evanno's plot of K (number of genetic clusters) against corresponding mean estimated log-normal (Ln) probability of the data (dark red dots) and ΔK (light blue dots); (b) Population structure analysis of wild + cultivated *Ipheion uniflorum* specimens ($n=61$) based on $K=3$ and 2302 unlinked SNPs. Each bar represents one individual and colored segments represent the relative memberships to each genetic cluster.

Table S1. Subsampling of the morphological data.

Specimen	Region	Tepal apex	Flower colour	Floral tube length	Outer tepal width	Inner tepal width	Outer tepal length	Inner tepal length

Codification: Tepal apex: 0: obtuse, 1: acute; 2: round. Flower color: 0: white; 1: blue/light blue; 2: pink or lilac; 3: violet.

Table S2. Summary of quantitative and qualitative morphological data portraying the variation found among natural and cultivated specimens of *Ipheion uniflorum*.

Condition	Tepal apex	Flower colour	Tepal width	Tepal length	Plant size
natural	0/1/2	0/1/2	0.3-1.1 cm	2-3 cm	6-20 cm
cultivated	0/1/2	0/1/2/3	0.5-1.1 cm	2-4 cm	7-30(40) cm

Data from natural populations: [9, 10]. Data from cultivated samples: [11, 12] and descriptive information provided by shops offering bulbs of SSF. Character codification follows Sassone et al. [19].
