**Table S 1.** Listing of the 32 GCMs and Emission Scenarios available in the CMIP5, LOCA Archive

Model Short Name	Organization	Emissions Scenarios
access1-0	Commonwealth Scientific and Industrial Research Organization and Bureau of Meteorology, Australia	RCP4.5, RCP8.5
access1-3	Commonwealth Scientific and Industrial Research Organization and Bureau of Meteorology, Australia	RCP4.5, RCP8.5
bcc-csm1-1	Beijing Climate Center, China Meteorological Administration	RCP4.5, RCP8.5
bcc-csm1-1-m	Beijing Climate Center, China Meteorological Administration	RCP4.5, RCP8.5
canesm2	Canadian Centre for Climate Modelling and Analysis	RCP4.5, RCP8.5
ccsm4	National Center for Atmospheric Research	RCP4.5, RCP8.5
cesm1-bgc	Community Earth System Model Contributors	RCP4.5, RCP8.5
cesm1-cam5	Community Earth System Model Contributors	RCP4.5, RCP8.5
cmcc-cm	Centro Euro-Mediterraneo per I Cambiamenti Climatici	RCP4.5, RCP8.5
cnrm-cm5	Centre National de Recherches Météorologiques/ Centre Européen de Recherche et Formation Avancée en Calcul Scientifique	RCP4.5, RCP8.5
csiro-mk3-6-0	Commonwealth Scientific and Industrial Research Organization, Queensland Climate Change Centre of Excellence	RCP4.5, RCP8.5
ec-earth	EC-Earth consortium, representing 22 academic institutions and meteorological services from 10 countries in Europe	RCP4.5, RCP8.5
fgoals-g2	Laboratory of Numerical Modeling for Atmospheric Sciences and Geophysical Fluid Dynamics, Institute of Atmospheric Physics, Chinese Academy of Sciences, and Center for Earth System Science, Tsinghua University	RCP4.5, RCP8.5
gfdl-cm3	NOAA Geophysical Fluid Dynamics Laboratory	RCP4.5, RCP8.5
gfdl-esm2g	NOAA Geophysical Fluid Dynamics Laboratory	RCP4.5, RCP8.5
gfdl-esm2m	NOAA Geophysical Fluid Dynamics Laboratory	RCP4.5, RCP8.5
giss-e2-r	NASA Goddard Institute for Space Studies	RCP4.5, RCP8.5
hadgem2-ao	Met Office Hadley Centre (additional HadGEM2ES realizations contributed by Instituto Nacional de Pesquisas Espaciais)	RCP4.5, RCP8.5
hadgem2-cc	Met Office Hadley Centre (additional HadGEM2ES realizations contributed by Instituto Nacional de Pesquisas Espaciais)	RCP4.5, RCP8.5
hadgem2-es	Met Office Hadley Centre (additional HadGEM2ES realizations contributed by Instituto Nacional de Pesquisas Espaciais)	RCP4.5, RCP8.5
inmcm4	Institute for Numerical Mathematics	RCP4.5, RCP8.5
ipsl-cm5a-lr	Institut Pierre-Simon Laplace	RCP4.5, RCP8.5
ipsl-cm5a-mr	Institut Pierre-Simon Laplace	RCP4.5, RCP8.5

<b>Model Short Name</b>	<b>Organization</b>	<b>Emissions Scenarios</b>
miroc-esm	Japan Agency for Marine-Earth Science and Technology, Atmosphere and Ocean Research Institute (The University of Tokyo), and National Institute for Environmental Studies	RCP4.5, RCP8.5

Precipitation depth truncation source (Table S 13)	Scaled LOCA max 2071-2099 <sup>2</sup>	Scaled 24-hr, recurrence intervals <sup>4</sup>	Scaled LOCA max 2071-2099 <sup>2</sup>

<sup>1</sup> Data Interval, 1981 – 2010, always employs the same formulation and is the same across all three scenarios.

<sup>2</sup> Scaled LOCA maximums are calculated starting with the PRISM 1981-2010 monthly maximum values in note #3. These values are multiplied by a scaling factor calculated as the LOCA maximum across all grid cells in **Figure 1** for the interval divided by the PRISM 1981-2010 daily maximum value across all grid cells, see **Table S 13**.

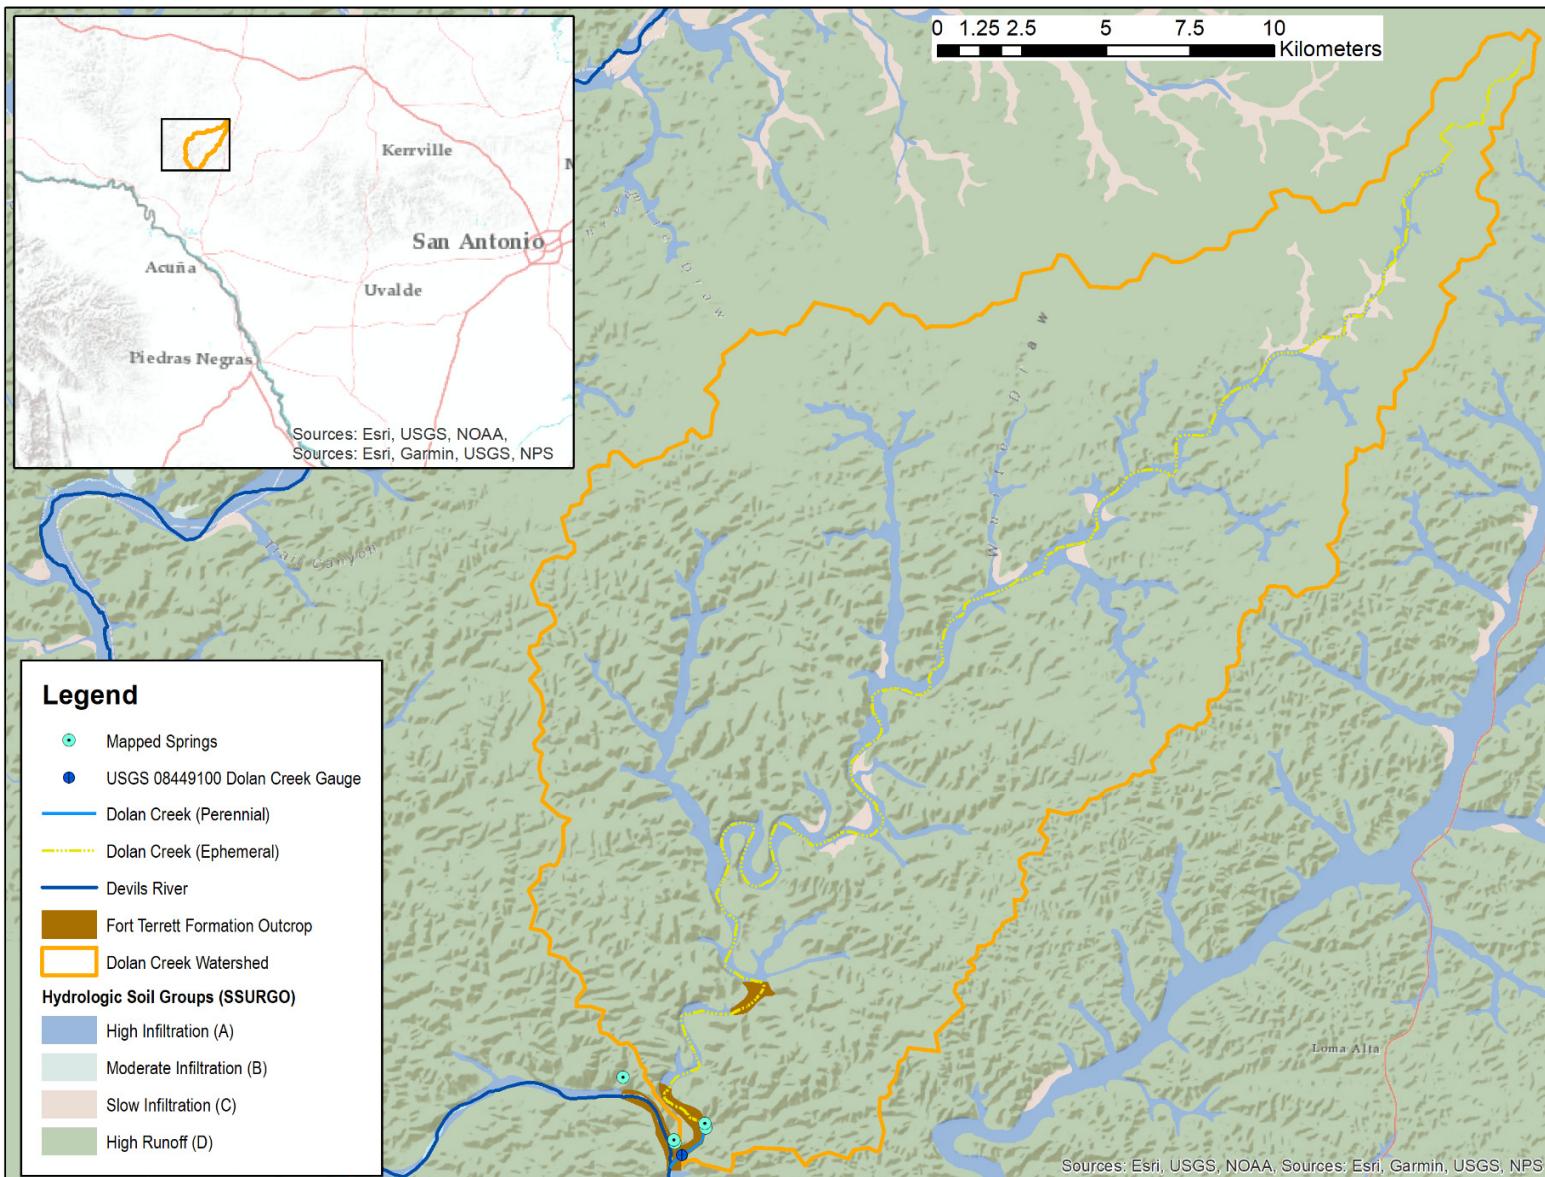

<sup>3</sup> The maximum daily precipitation depth from all PRISM 1981-2010 grid cells in **Figure 1** is used to truncate the mixed exponential, precipitation depth distributions for each month, see **Table S 13**.

<sup>4</sup> PRISM 1981-2010 monthly maximum values from #3 provide the starting point in this calculation and these values are multiplied by a scaling factor, which is calculated as a specified extreme event depth divided by the PRISM 1981-2010 daily maximum value across all grid cells. For Projection Interval 1: 2011-2040 the extreme event depth used to calculate the scaling factor is the 50-yr recurrence interval, 24-hr depth from **Table C - 1**. The 100-yr recurrence interval, 24-hr depth from **Table C - 1** is used in the scaling factor calculation for Projection Interval 3 and the average of the 50-yr and 100-yr depths is used in scaling factor determination for Projection Interval 2, see **Table S 13**.

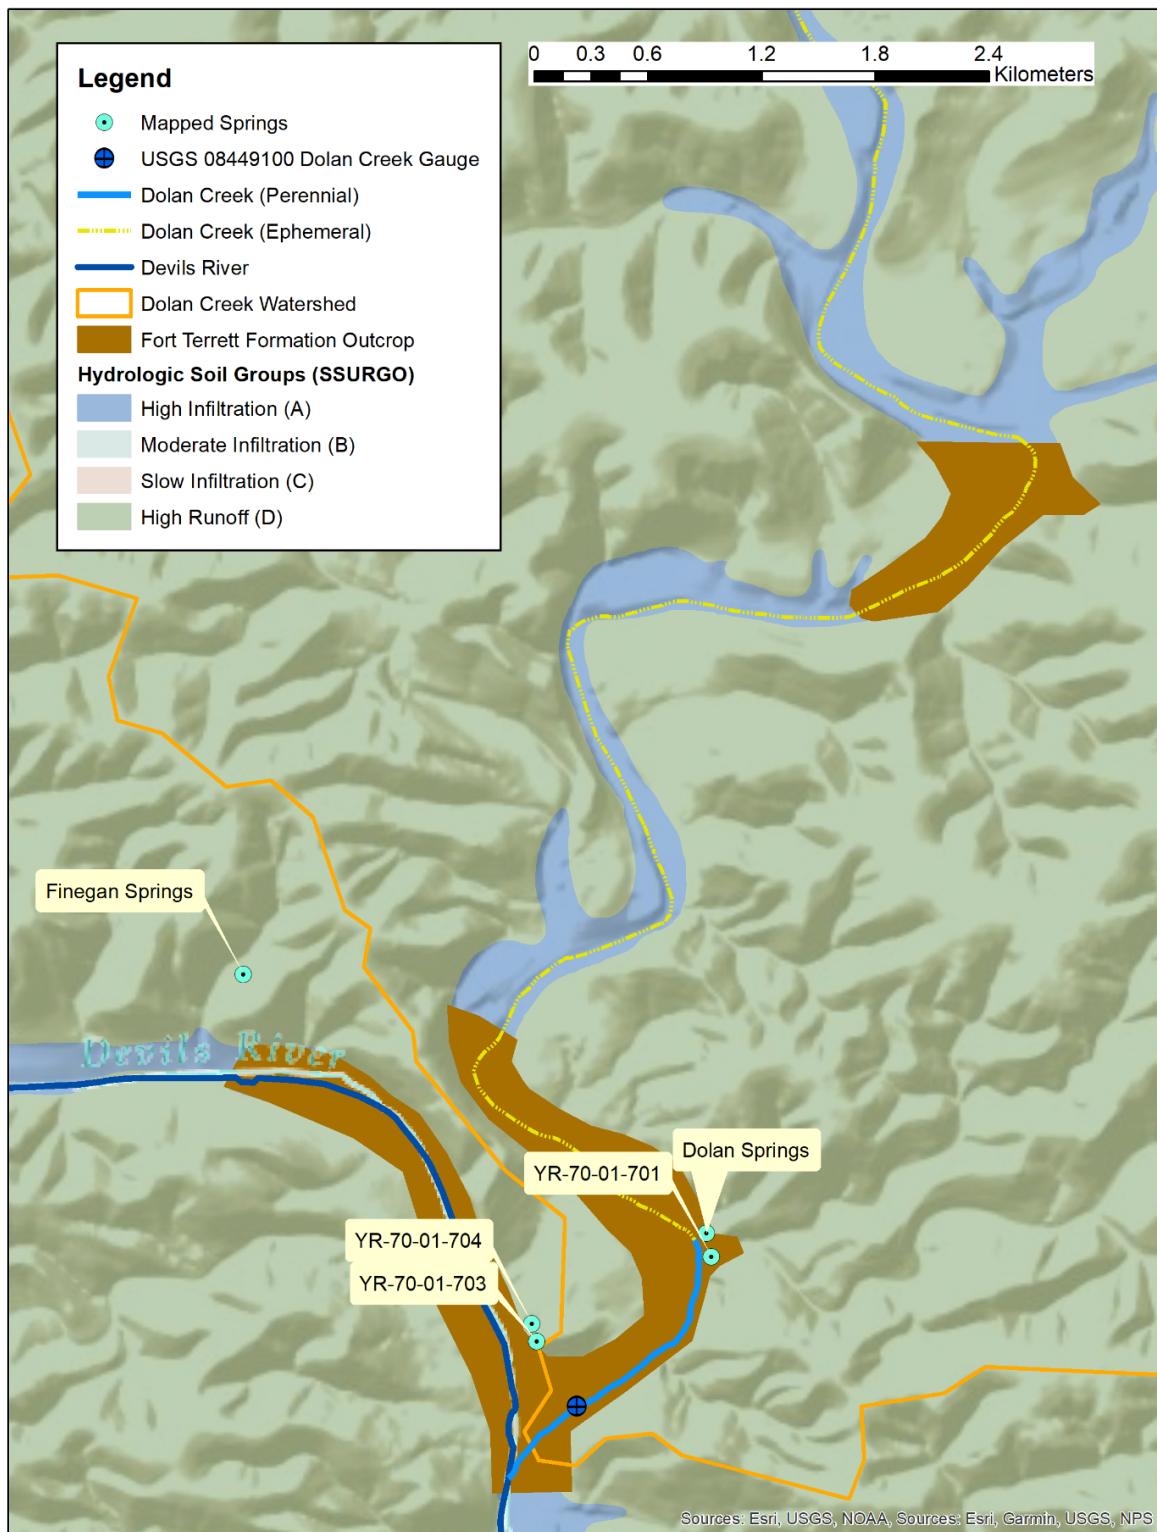

**Table S 17.** Pertinent Soil Properties from SSURGO

Descriptor	Value	Percentage of Watershed	Notes
Hydrologic Soil Group	D: Very slow infiltration and high runoff	92%	General condition outside of dry stream beds
Hydrologic Soil Group	C: Slow infiltration	1%	
Hydrologic Soil Group	A: High infiltration	7%	Located only in dry stream beds and valley bottoms
Available Water Supply	1 – 2 cm	88.5%	Uplands and away from stream beds
Available Water Supply	3 – 4 cm	4%	Valley bottom areas outside of stream beds
Available Water Supply	10 – 23 cm	7.5%	Stream beds
Depth to Restrictive Layer	> 201 cm	8.2%	Stream beds
Depth to Restrictive Layer	30 – 50 cm	53.7%	Hillsides
Depth to Restrictive Layer	20 – 25 cm	38.1%	Ridgetops

**Figure S - 1.** Study Site Location and Watershed Showing Hydrologic Soil Groups. The study site is located to the west of San Antonio, TX. Hydrologic soil group mapping suggest that dry stream valleys are the primary location of infiltration.

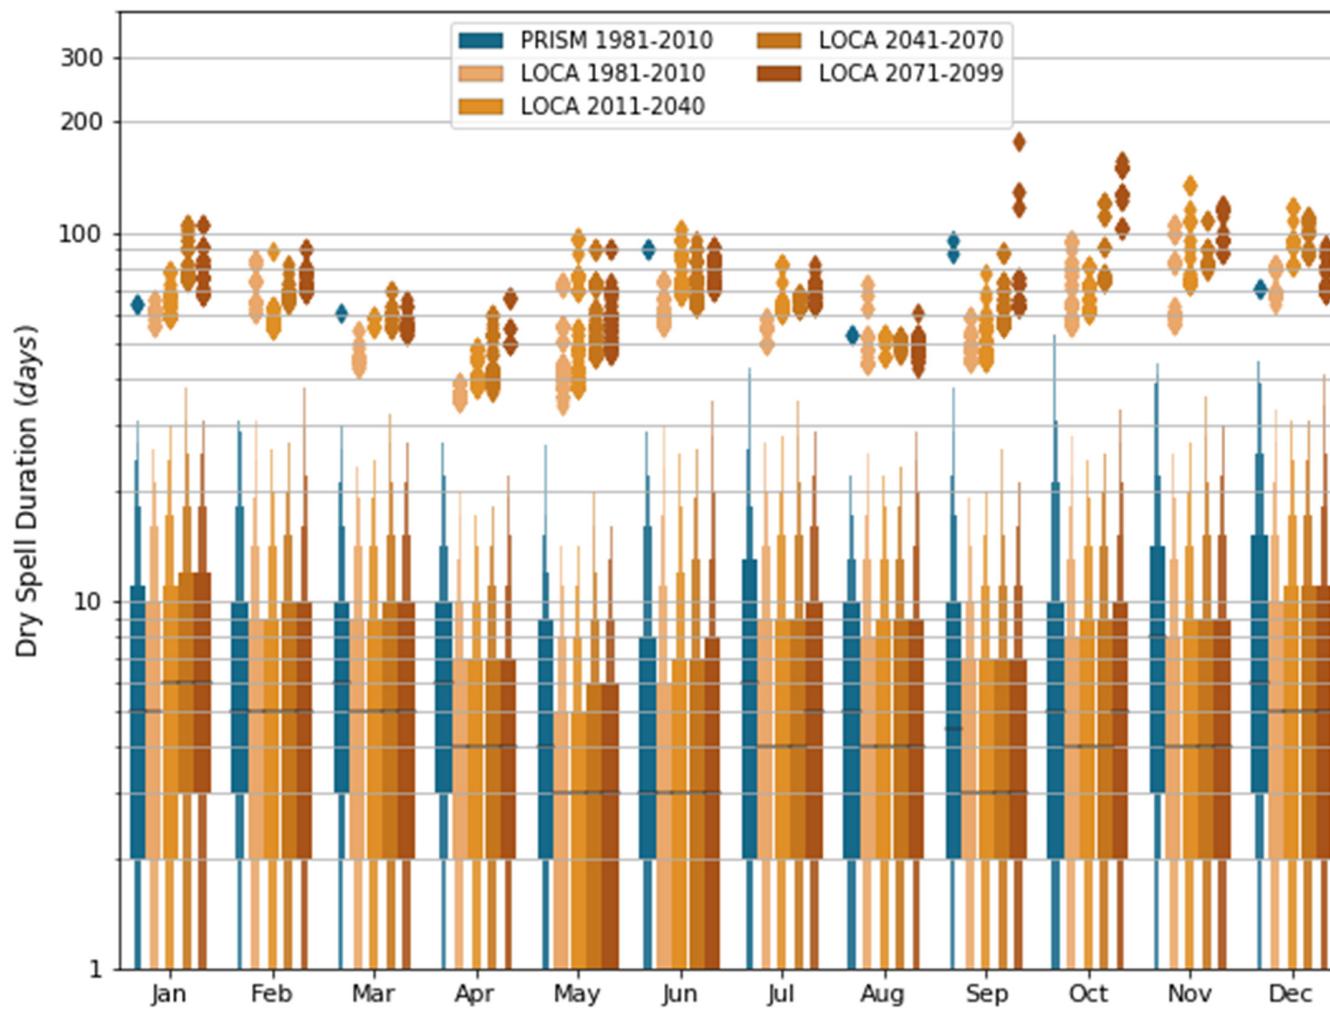

**Figure S - 2.** Dolan Creek and Devils River Confluence, Fort Terrett Limestone Outcrop, and Mapped Spring Locations. Dolan Creek is ephemeral and typically dry except for the downstream-most segment adjacent to the confluence with the Devils River. This perennial reach corresponds to outcrop locations for the Fort Terrett limestone and the location of Dolan Springs. The Fort Terrett limestone is hypothesized to provide an impermeable base to the watershed. Spring discharge is hypothesized to occur at or associated with the contact of the Fort Terrett and overlying Segovia limestone.

**Figure S - 3.** Schematic of Thornthwaite and Mather-style water balance calculation. Precipitation (P) and potential evapotranspiration (PET) are the inputs to the calculation. In this implementation, PET is estimated from simulated air temperature. If  $P \geq PET$ , then  $P - PET$  provides the water distributed through the soil column in the calculation steps. If  $P < PET$ , then actual evapotranspiration (AET) is limited by the available water supply, which is comprised of P and available soil moisture supply.

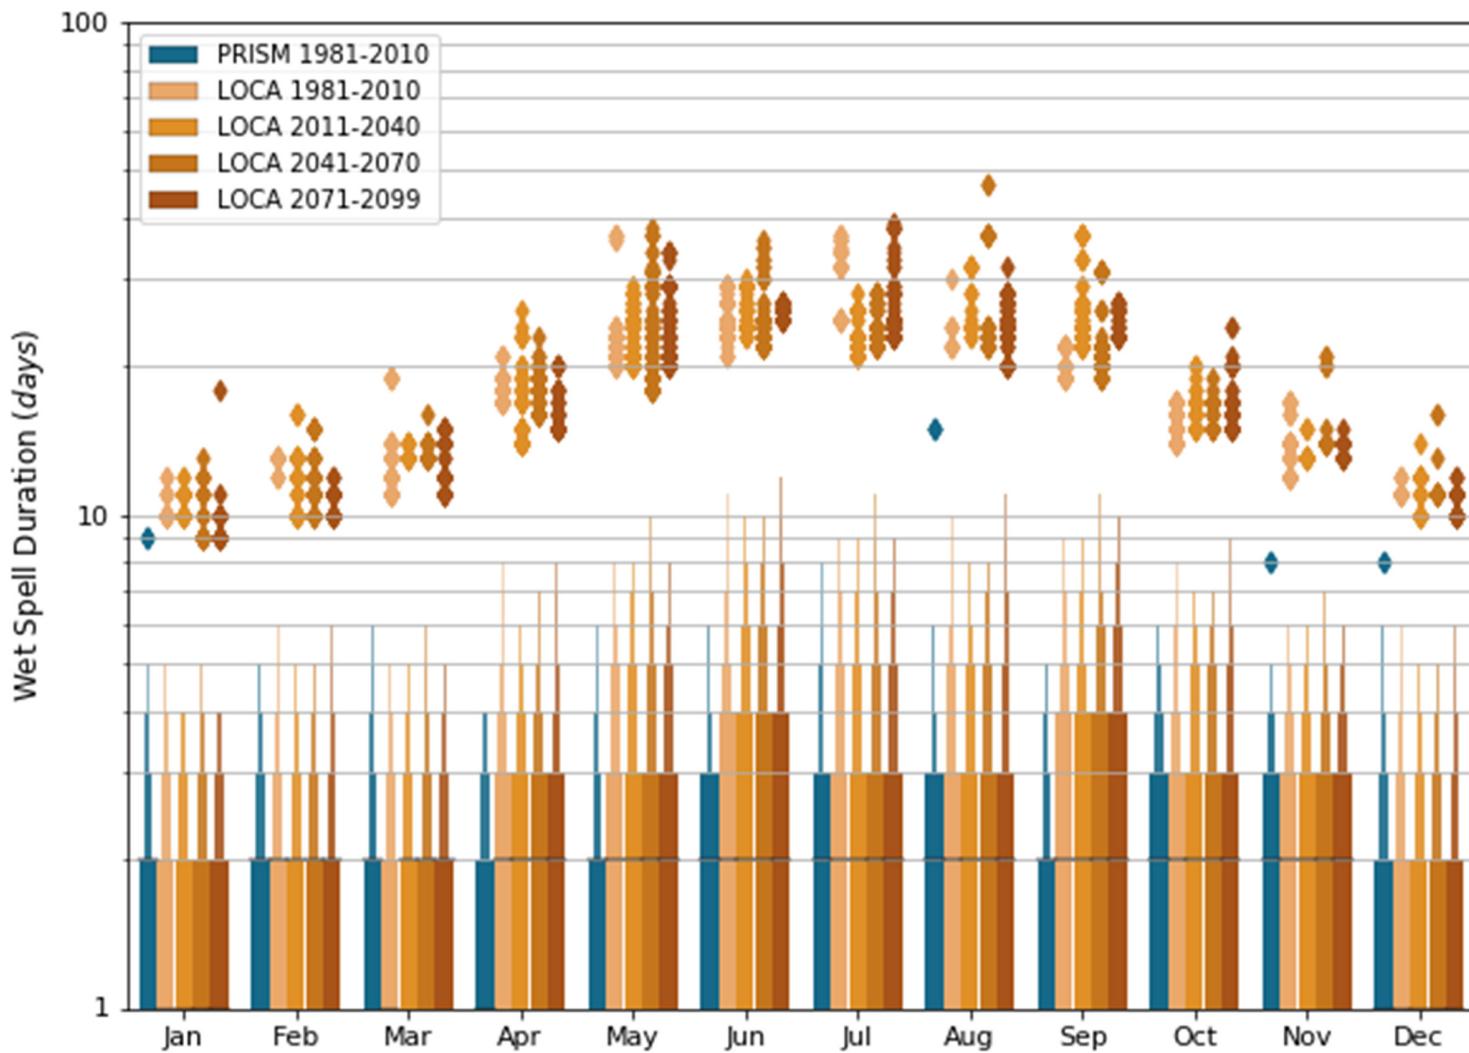

**Figure S - 4.** Average Temperature, Day of the Year Wet State and Dry State Comparison. Day of the year averages are calculated for both data sets and all four Climate Normals. Temperature consistently increases for future Climate Normals.

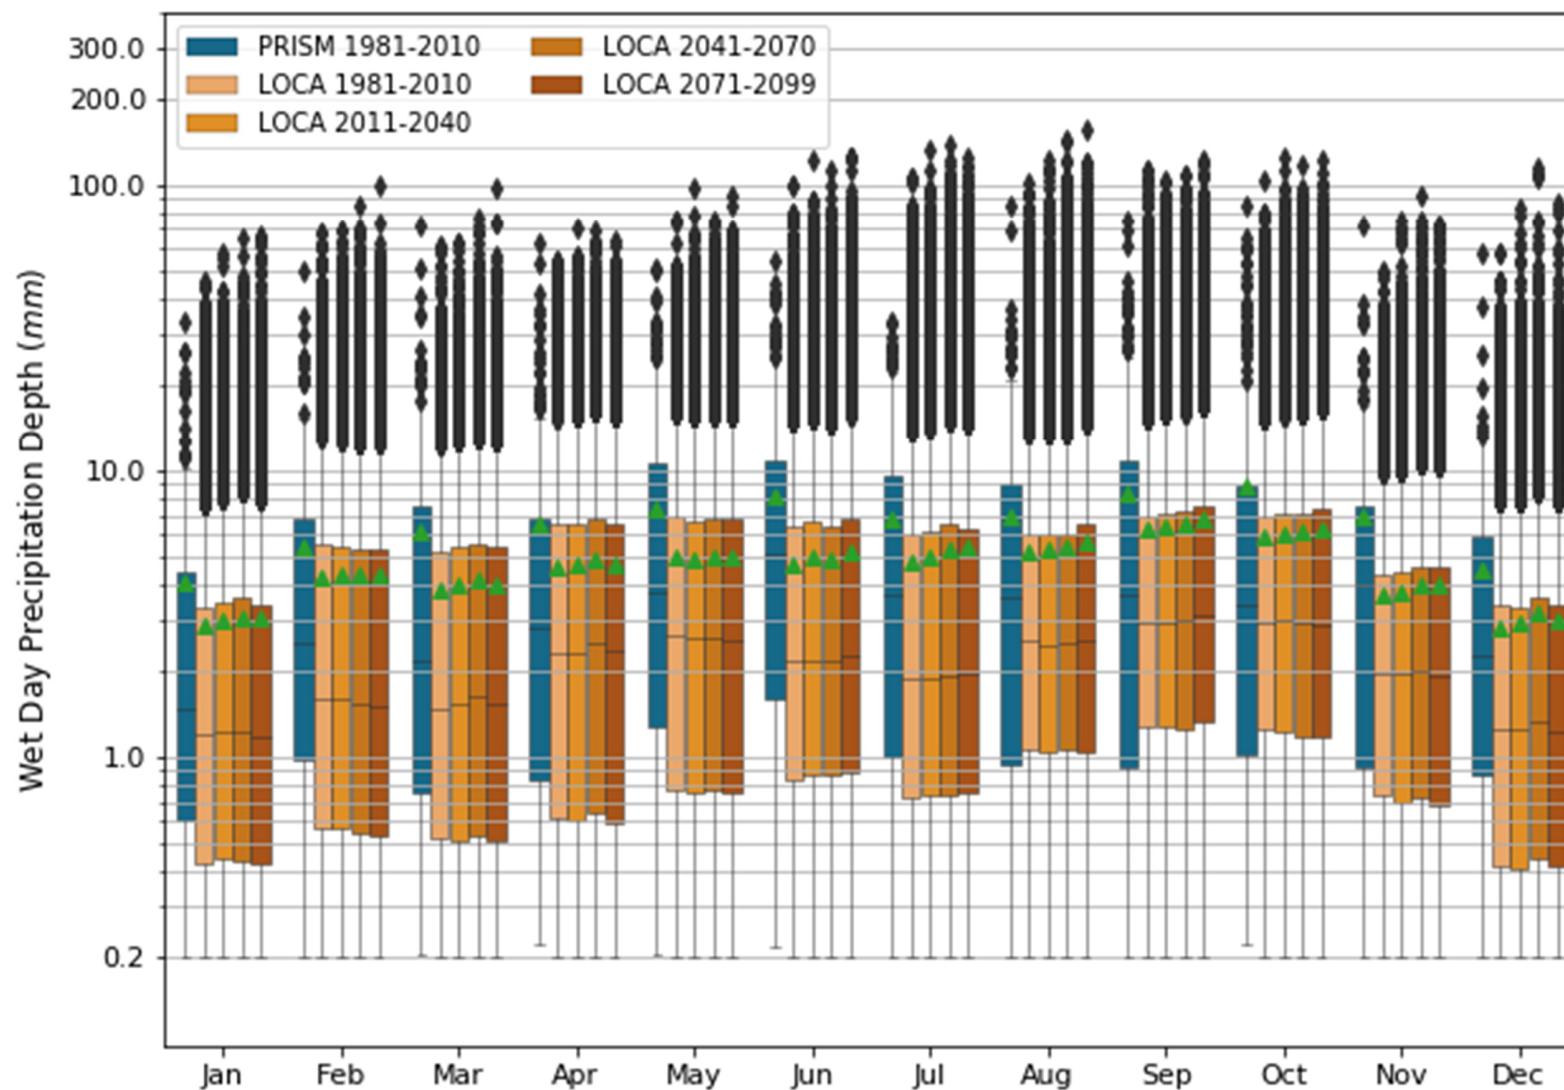

**Figure S - 5.** Observed Dry Spell Durations by Month and Data Set. A letter-value (Hofmann et al., 2017), or boxen (Waskom et al., 2020), plot is similar to the box plot, or box and whisker plot, and is optimized for showing additional information and structure of the empirical distribution of the data set within designated categories. In the boxen plot, the horizontal gray line denotes the median; a number of quantiles are also shown which are defined as “letter” values. The innermost and thickest box, which is the box containing the median, is the interquartile box (1/4 and 3/4 quantiles) and is equivalent to the box plot box. The next box out from the interquartile box, which is the next thickest, represents the eighths (1/8

and 7/8 quantiles). Beyond the eighths are the sixteenths (1/16 and 15/16 quantiles) and so forth. Dry spell length is attributed to the month when the contiguous streak of dry days begins. LOCA dry spell length, empirical distributions are similar across all four analysis intervals. Median dry spell length from the LOCA Archive is smaller than median dry spell length in the PRISM data set for March – May and July – December, which is 9 out of 12 months. Additionally, the 25th percentile dry spell length (1/4 quantile) in the LOCA Archive is shorter than the 25th percentile dry spell length in the PRISM data set for February – June and November – December, which is 7 out of 12 months.

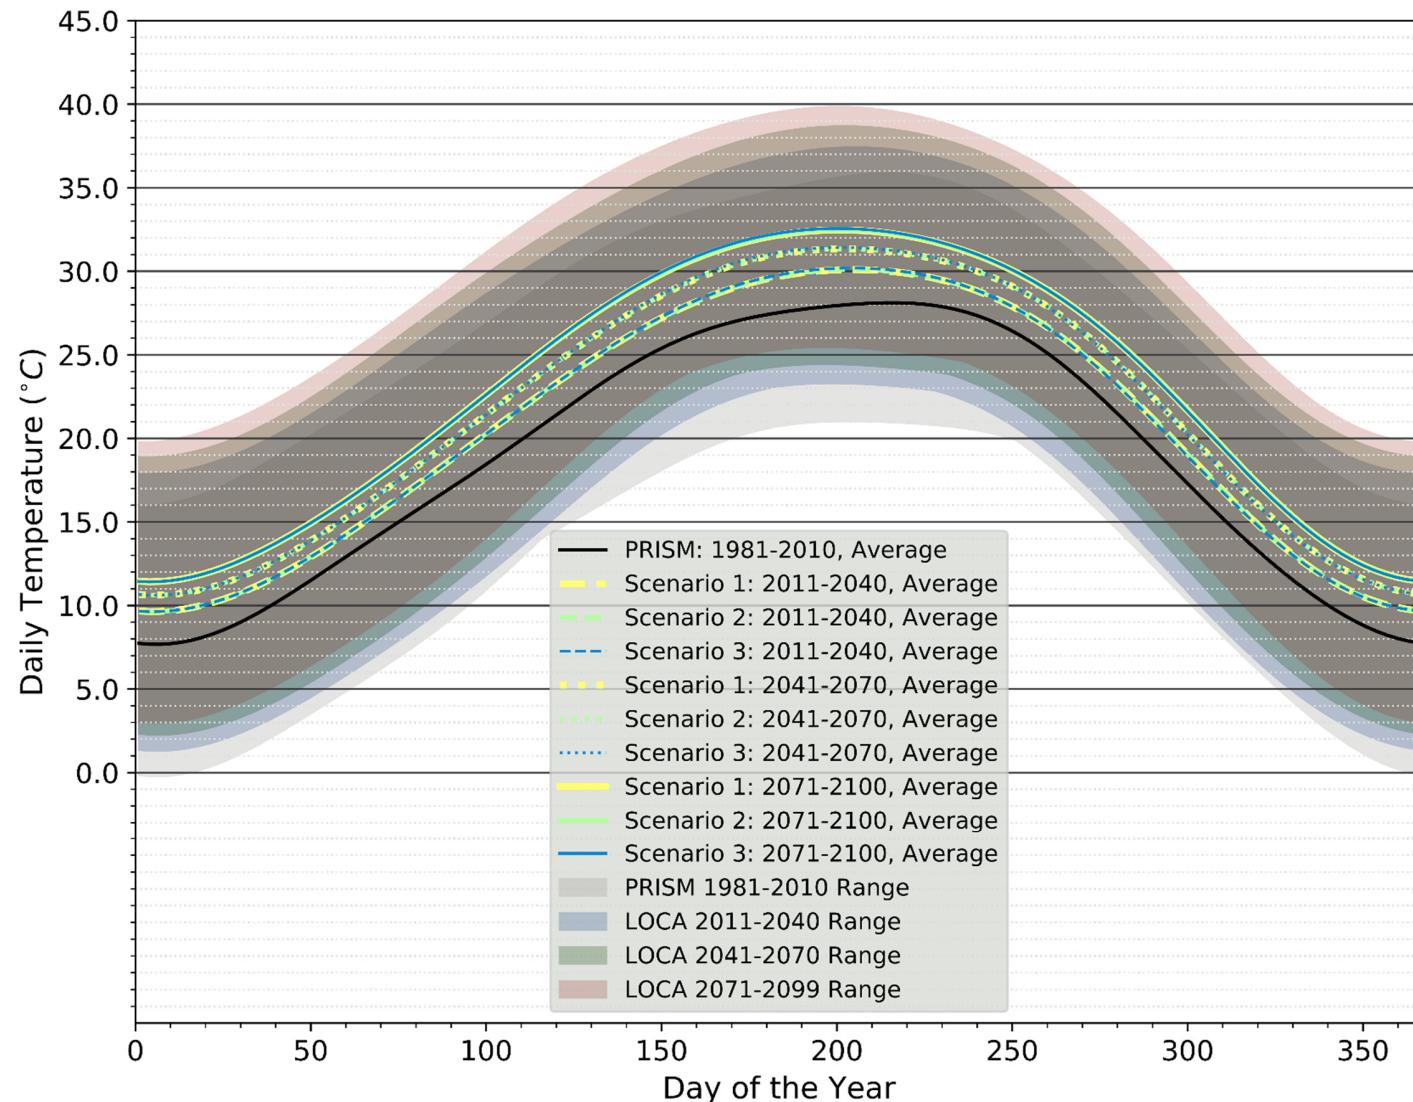

**Figure S - 6.** Observed Wet Spell Durations by Month and Data Set. Wet spell length, monthly letter-value plot. Wet spell length is attributed to the month when the contiguous streak of wet days begins. LOCA wet spell length, interquartile ranges are similar across all four analysis intervals and the empirical distributions are similar except for some variation in the high magnitude tails. The larger magnitude tail of the empirical LOCA

wet spell length distributions, for example compare the 7/8 quantile, extends to consistently larger values than the 7/8 quantile in the PRISM data set for April – September, which is 6 of 12 months.

**Figure S - 7.** Observed Site Watershed, Wet Day Precipitation Depth by Month and Data Set. LOCA empirical distributions are similar across all four intervals and tend to have similar mean and median values. LOCA mean and median values are consistently smaller than PRISM mean and

median values. PRISM mean and median values, shown for each month, display more variation across the year than the LOCA mean and median values. The LOCA ensembles provide maximum, daily values for each month that tend to be larger than the PRISM maximum daily values; this is expected from the comparison of an ensemble to a single realization.

**Figure S - 8.** Simulated Daily Temperature by Day of the Year, Compared with Temperature Observations from PRISM 1981 – 2010 and the ‘LOCA Archive’. Simulated temperature values are effectively the same for each scenario as expected. Additionally, simulated average daily

temperatures provide an approximately 3 °C increase from 1981-2010 through 2070-2100. Temperature curves are smoothed or filtered average time histories. The upper range bound is the smoothed, average day of the year maximum temperature, and the lower range bound is the smoothed, average day of the year minimum temperature.
