

Supplemental Materials

This document details the data used to calculate the direct economic impacts of taking a standard 150-acre irrigated farm out of production in each county of the study area ($EI_{Ag\ Direct, c, t}$).

S.1 Calculating $EI_{Ag\ Direct, c, t}$

The components of $EI_{Ag\ Direct, c, t}$ are restated in equations S1, S2, and S3.

$$S_{c,y} = \frac{HA_{c,y}}{\sum_Y HA_{c,y}} \quad (S1)$$

$$EI_{Ag\ Direct,c,y,t} = S_{c,y} \times 150 \times P_{y,t} \times Q_{y,t} \quad (S2)$$

$$EI_{Ag\ Direct,c,t} = \sum_Y EI_{Ag\ Direct,c,y,t} \quad (S3)$$

Where $HA_{c,y}$: Harvested irrigated acres of crop y in county c

$S_{c,y}$: Share of harvested irrigated acres of crop y in county c

$P_{y,t}$: Price of crop y in year t

$Q_{y,t}$: Yield per acre of crop y in year t

In 2009, 2016, and 2020, researchers from University of Georgia and Albany State University were contracted by the Georgia Department of Natural Resources (GADNR) to map irrigated agricultural fields in ArcGIS using aerial images. Those maps are proprietary data owned by the GADNR. The 2020 map of irrigated fields was overlaid with 2020 data from CropScape (available at <https://nassgeodata.gmu.edu/CropScape/>) and county boundaries to identify the acreage of crops grown on irrigated fields in each county of the state. Those data were used to estimate the harvested irrigated acres of each crop in each county ($HA_{c,y}$) and are presented in Table S1.

Table S1: 2020 Harvested Irrigated Acres, by Crop and County

County	Corn	Cotton	Peanut	Soybean	TOTAL
Baker	9,645	12,399	16,143	6	38,193
Calhoun	8,383	5,843	9,843	77	24,146
Decatur	12,502	21,810	27,622	487	62,421
Dougherty	2,026	3,734	2,184	6	7,950
Early	7,978	15,971	17,169	75	41,193
Lee	11,095	14,529	7,943	131	33,698
Miller	14,196	16,840	23,494	65	54,595
Mitchell	12,557	30,903	27,981	50	71,491
Randolph	8,130	6,466	9,483	875	24,954
Terrell	10,257	10,029	6,898	492	27,676
Worth	5,050	27,236	17,013	34	49,333

The crop acreage shares ($S_{c,y}$) are calculated via equation S3 using the data in Table S1. The resulting shares are presented in Table S2.

Table S2: 2020 Share of Irrigated Acreage, by Crop and County

County	Corn	Cotton	Peanut	Soybean	TOTAL
Baker	0.253	0.325	0.423	0.000	1
Calhoun	0.347	0.242	0.408	0.003	1
Decatur	0.200	0.349	0.443	0.008	1
Dougherty	0.255	0.470	0.275	0.001	1
Early	0.194	0.388	0.417	0.002	1
Lee	0.329	0.431	0.236	0.004	1
Miller	0.260	0.308	0.430	0.001	1
Mitchell	0.176	0.432	0.391	0.001	1
Randolph	0.326	0.259	0.380	0.035	1
Terrell	0.371	0.362	0.249	0.018	1
Worth	0.102	0.552	0.345	0.001	1

Price and yield information for each crop and county are taken from the Georgia Farm Gate Value Report 2020 (available at <https://caed.uga.edu/publications/farm-gate-value.html>) and used in equation S2 to calculate $EI_{Ag\ Direct, c, y}$. The price and yield data are reported in Table S3.

Table S3: 2020 Crop Price and Yield, by County

County	Corn		Cotton		Peanut		Soybean	
	\$/bu	Bu/acre	\$/lb	Lb/acre	\$/lb	Lb/acre	\$/bu	Bu/acre
Baker	\$4.25	180	\$0.70	900	\$0.22	4300	\$10.00	60
Calhoun	\$4.90	200	\$0.65	1000	\$0.22	4600	\$8.35	52
Decatur	\$4.30	216	\$0.65	869	\$0.20	4533	\$10.40	41
Dougherty	\$4.30	180	\$0.65	887	\$0.20	5200	\$10.40	41
Early	\$4.30	190	\$0.70	880	\$0.20	4250	\$10.40	45
Lee	\$3.90	186	\$0.65	1000	\$0.19	4100	\$10.40	41
Miller	\$4.30	190	\$0.70	915	\$0.23	4700	\$12.00	45
Mitchell	\$4.30	202	\$0.65	900	\$0.20	4245	\$10.40	41
Randolph	\$4.90	190	\$0.65	900	\$0.20	4400	\$11.00	47
Terrell	\$4.25	190	\$0.75	1100	\$0.22	4000	\$11.00	50
Worth	\$4.30	205	\$0.65	930	\$0.20	4300	\$10.40	45

S.2 Calculating County-level Fixed Costs of Source Switching (FC_c)

The fixed costs from source switching are calculated using equation 12 in the main text, shown here as equation S4. FC_c depends on the costs per foot of drilling, lining, and capping the well ($C_{Drilling,c,t}$) in county c in year t , and the well depth ($Depth_c$). $Depth_c$ is the average depth (feet) to the aquifer in county c .

$$FC_{c,t} = C_{Drilling,c,t} \times Depth_c \quad (S4)$$

To estimate $C_{Drilling,c,t}$, four irrigation well drilling companies located in the lower Flint River Basin were interviewed by phone in March of 2021. The drilling companies all emphasized that actual costs would vary by location, depending on geological conditions encountered at the well site. Nonetheless, from those interviews, the average cost per foot for a

new well in the study area was \$240/foot in 2021. We used the US Bureau of Labor Statistics inflation calculator (available at https://www.bls.gov/data/inflation_calculator.htm) to convert the 2021 cost estimate to 2020 dollars (\$233.88/foot).

Average well depth to the Claiborne aquifer by county was used to estimate Depth_c. The data used to calculate Depth_c are reported in Table S4. Those data come from the USGS website <http://doi.org/waterdata.usgs.gov/nwis/>.

S.3 Calculating County-level Extra Pumping Costs of Source Switching (VC_c)

The extra pumping costs of source switching were calculated using equations S5-S8.

$$\Delta TDH_c = psi \times 2.31 + \Delta Depth_c \quad (S5)$$

$$Water_{ESS,c,t} = \sum_{y=1}^4 WD_{ESS,c,y,t} \times S_{c,y} \times 150 \quad (S6)$$

$$\Delta Total\ fuel\ consumed_{ESS,c,t} = Fuel\ usage \times \Delta TDH_c \times Water_{ESS,c,t} \quad (S7)$$

$$VC_{ESS,c,t} = \Delta Total\ fuel\ consumed_{ESS,c,t} \times P_{Electricity,t} \quad (S8)$$

In equation S5, the average well depth in the Claiborne aquifer reported in Table S4 is used as an estimate for ΔDepth_c when switching from a surface water source to the Claiborne. When switching for a Floridan aquifer well to a well in the Claiborne, the difference between a county's average well depth in the two aquifers is used.

In equation S6, the acreage shares for each crop reported in Table S2 are used for S_{c,t}. WD_{ESS,c,y,t} is the water application rate (acre-feet/acre) for crop *y* in county *c* in year *t* during a drought year or an average year. The Decision Support System for Agrotechnology Transfer (DSSAT) was used to model irrigation application rates in the study area under historical weather conditions from 1950-2020. DSSAT is available for download at <https://dssat.net/data>. The 90th

percentile water application rate from the DSSAT runs for each crop and county was used as the estimate of $WD_{ESS,c,y,t}$ during drought. The 50th percentile water application rate was used as the estimate of $WD_{SSS,c,y,t}$. Those values are presented in Table S5.

We use the electricity fuel requirement of 1.55 kwh/acre-foot/foot reported in Roger (1999) as our estimate of Fuel Usage. The price of electricity is from Georgia Power, the electricity provider in the study area. We used a weighted average of the “Off-Peak” Irrigation Rate (<https://www.georgiapower.com/content/dam/georgia-power/pdfs/electric-service-tariff-pdfs/IOP-15.pdf>) and the “On-Peak” Farm Service Schedule rate (<https://www.georgiapower.com/content/dam/georgia-power/pdfs/electric-service-tariff-pdfs/FS-11.pdf>), assuming 1/3 of irrigation water is applied on-peak (between noon and 8:00 pm) and the other 2/3 is applied off-peak.

Table S4: Well Depth Data
