Patterns and Predictors of Phytoplankton Assemblage Structure in a Coastal Lagoon: Species-Specific Analysis Needed to Disentangle Anthropogenic Pressures from Ocean Processes

Maria João Lima, Ana B. Barbosa, Alexandra Cravo, Cátia Correia, André Matos

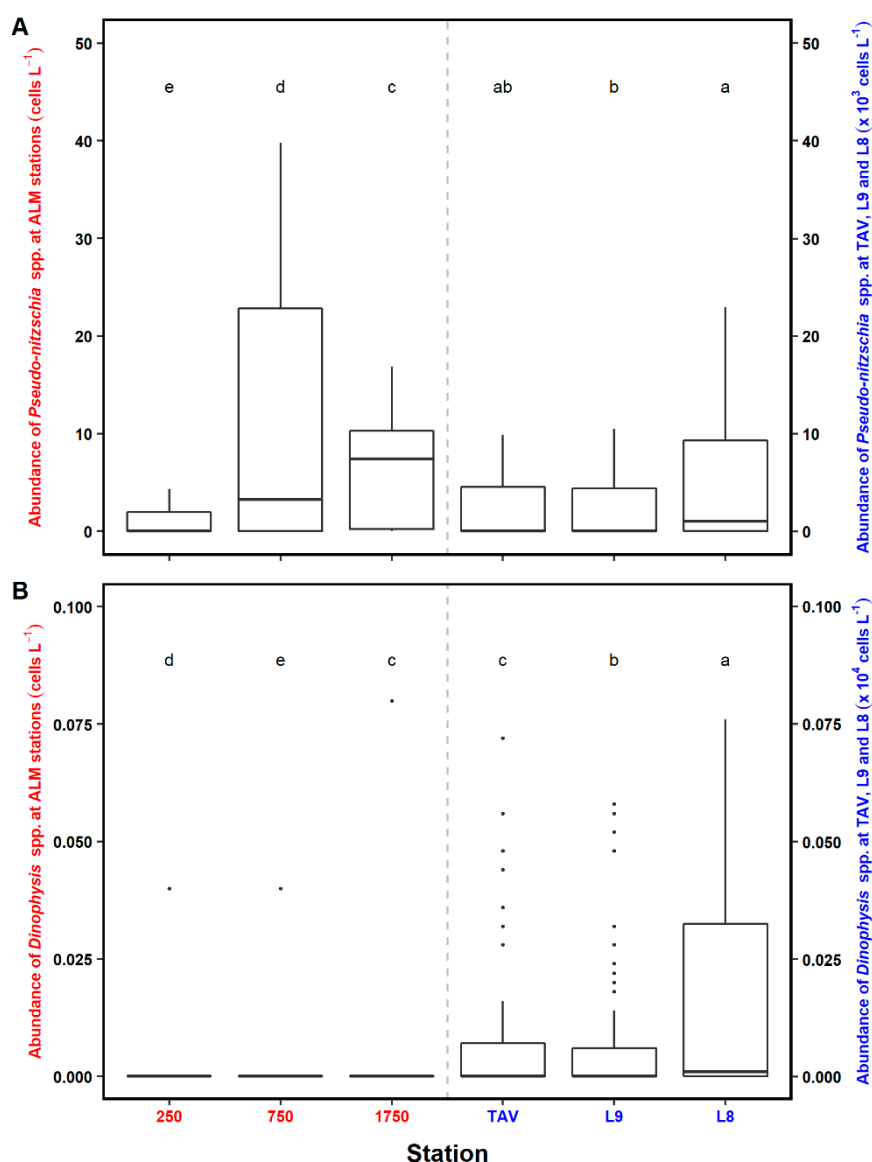

Centre for Marine and Environmental Research (CIMA), ARNET—Aquatic Research Network, Universidade do Algarve, Campus of Gambelas, 8005-139 Faro, Portugal.

Supplementary Figure S1 – Daily time series of rainfall precipitation (left y-axis), measured at Tavira land-based meteorological station (Source: Direção Regional de Agricultura e Pescas do Algarve, <https://www.drapalg.min-agricultura.pt/>), and Guadiana River discharge (right y-axis), measured at the hydrometric station Pulo do Lobo (Source: Portuguese Environmental Agency, <http://snirh.apambiente.pt/>), during the period September 2018 - September 2020.

Supplementary Figure S2 – Weekly (8-day) mean time series of selected oceanographic variables in the coastal region adjacent to the Tavira inlet, for the period September 2018 - September 2020. **(A)** Cross-shore Ekman transport (CSET; left y-axis), a wind-based upwelling index, and sea surface temperature (SST; right y-axis); and **(B)** Chlorophyll-a concentration (Chl-a; left y-axis) and SST (right y-axis). Negative and positive CSET values represent upwelling-favourable, and downwelling-favourable conditions, respectively. See Figure 1 for the location of the site used to derive CSET, and the coastal area used to extract Chl-a and SST data.

Supplementary Figure S3 – Distribution of the abundance of **(A)** *Pseudo-nitzschia* spp. and **(B)** *Dinophysis* spp. in different sampling stations in the Ria Formosa lagoon, and in classified lagoonal (TAV) and coastal (L8, L9) shellfish production areas, during the period September 2018 - September 2020. Lagoon stations are located at 250 m (ALM 250), 750 m (ALM 750), and 1750 m (ALM 1750) from the discharge point of the Almargem wastewater treatment plant (WWTP). Median values are identified by the central line within the box, the bottom and top edges of the box indicate the 25th and 75th percentiles, respectively, and the whiskers represent non-outlier limits. For each phytoplankton group, different uppercase letters above the bars denote significant differences between stations/areas ($p < 0.05$), with abundances decreasing (higher - lower) in alphabetical order (a - e). Note differences in scale for lagoon stations (red left y-axis) and shellfish production areas (blue right y-axis). See Fig. 1 for the location of sampling stations in the Ria Formosa lagoon and adjacent coastal area.

Supplementary Table S1 – General statistical information, including mean, standard deviation (SD), minimum (Min) and maximum (Max) values, and number of samples (N), for meteorological, hydrological, and oceanographic variables, during the period September 2018 - September 2020. Information on the effluents discharged by the Almargem wastewater treatment plant, including monthly average effluent discharge rate, and total nitrogen and phosphorus loads, was provided by Águas do Algarve (AdA), the water supply company. * Data only available after July 2019.

Variable	Mean \pm SD	Min - Max	N
Rainfall precipitation (mm d ⁻¹)	0.9 \pm 3.3	0.0 – 29.2	761
Almargem Stream discharge (m ³ s ⁻¹)*	0.000249 \pm 0.00339	0.0 – 0.05	441
Guadiana River discharge (m ³ s ⁻¹)	9.7 \pm 8.1	2.3 – 61.9	496
Effluent discharge rate (m ³ d ⁻¹)	4092.6 \pm 862.0	2512.6 – 6374.5	25
Effluent total nitrogen load (kg N d ⁻¹)	33.10 \pm 26.95	10.98 – 127.46	25
Effluent total phosphorus load (kg P d ⁻¹)	15.38 \pm 10.47	2.66 – 46.98	25
Sea surface temperature (°C)	18.5 \pm 2.3	15.7 – 23.9	95
Cross-shore Ekman Transport (m ³ s ⁻¹ km ⁻¹ coastline)	-96.6 \pm 662.5	-1346.6 – 2907.9	96

Supplementary Table S2 – General statistical information, including mean, standard deviation (SD), minimum (Min) and maximum (Max) values, and number of samples (N) for different water physical-chemical variables evaluated in three sampling stations in the Ria Formosa lagoon, during the period September 2018 - September 2020. Stations are located at 250 m (ALM 250), 750 m (ALM 750), and 1750 m (ALM 1750) from the discharge point of the Almargem wastewater treatment plant. Significant differences between ALM stations ($p < 0.05$), tested by Durbin's rank test, followed by post-hoc pairwise comparisons, are also included.

Variable	Station	Mean \pm SD	Min - Max	N	Differences between (ALM) stations
Temperature ($^{\circ}\text{C}$)	250	22.8 ± 4.8	14.4 – 30.6	20	250 > 750 > 1750
	750	22.3 ± 4.6	13.9 – 29.5	19	
	1750	20.8 ± 4.1	13.2 – 27.9	19	
Salinity	250	28.0 ± 5.1	9.3 – 32.2	20	250 < 750 < 1750
	750	32.0 ± 3.3	19.4 – 34.8	19	
	1750	36.3 ± 0.7	34.6 – 37.4	19	
pH	250	8.0 ± 0.3	7.7 – 9.0	20	250 < 1750
	750	8.1 ± 0.2	7.7 – 8.8	19	
	1750	8.1 ± 0.1	7.8 – 8.2	19	
Dissolved Oxygen (mg L^{-1})	250	10.3 ± 3.6	6.0 – 23.3	20	250 > 750 and 1750
	750	9.6 ± 3.1	4.5 – 19.5	19	
	1750	8.4 ± 0.7	6.4 – 9.6	19	
Dissolved Oxygen (% sat.)	250	143.3 ± 62.2	79.1 – 363.9	20	250 > 750 and 1750
	750	135.3 ± 50.9	67.8 – 302.0	19	
	1750	117.0 ± 11.2	89.8 – 135.4	19	
Total Suspended Solids (mg L^{-1})	250	12.3 ± 5.3	2.7 – 20.2	20	250 and 750 > 1750
	750	13.8 ± 11.3	1.9 – 53.3	19	
	1750	6.5 ± 3.9	0.7 – 17.6	19	
Ammonium (μM)	250	25.1 ± 34.5	0.7 – 124.6	20	250 > 750 > 1750
	750	9.7 ± 12.4	0.1 – 42.2	19	
	1750	0.7 ± 0.7	0.1 – 2.7	19	
Nitrate (μM)	250	10.0 ± 5.7	0.9 – 22.5	20	250 > 750 > 1750
	750	6.1 ± 3.8	0.5 – 14.7	19	
	1750	0.7 ± 0.9	0.04 – 4.2	19	
Nitrite (μM)	250	3.4 ± 2.4	0.8 – 9.0	20	250 > 750 > 1750

	750	1.8 ± 1.2	$0.05 - 4.1$	19	
	1750	0.1 ± 0.1	$0.01 - 0.3$	19	
Phosphate (μM)	250	13.1 ± 8.7	$1.8 - 33.7$	20	
	750	6.8 ± 4.3	$1.6 - 15.7$	19	$250 > 750 > 1750$
	1750	0.3 ± 0.2	$0 - 0.6$	19	
Silicate (μM)	250	37.6 ± 19.2	$0.5 - 97.1$	20	
	750	24.7 ± 12.5	$0.4 - 62.0$	19	$250 > 750 > 1750$
	1750	3.3 ± 1.5	$0.4 - 5.9$	19	

Supplementary Table S3 – List of phytoplankton operational taxonomic units (OTUs), identified to the lowest possible taxonomic level, detected in the Ria Formosa lagoon, during the period September 2018 - September 2020. Sampling stations are located at 250 m (ALM 250), 750 m (ALM 750), and 1750 m (ALM 1750) from the discharge point of the Almargem wastewater treatment plant. OTUs are organized alphabetically, within each phylum and class. Taxonomic and nomenclatural information according with AlgaeBase, accessed on 2023-11-02 [92]. Black circle symbol denotes OTUs present in more than 5% of samples. ‘B’ and ‘FW’ after selected OTUs represent benthic/tychoplanktonic and freshwater habitats, respectively. Potentially harmful species and harmful effects are also included, as follows: (a) potentially harmful but not toxigenic; (b) toxic to aquatic biota (including marine living resources); and (c) toxic to humans. Taxa not identified to the species level may also include potentially toxigenic genera (Cyanophyceae: *Oscillatoria/Planktothrix*; *Phormidium*; Dinophyceae: *Alexandrium*, *Amphidinium*, *Cochlodinium*, *Gonyaulax*, *Heterocapsa*, *Karenia*, *Margalefidinium*, *Ostreopsis*, *Scirpsiella*). Information sources for HAB effects: [5,93].

-----------------------------	--	-----------	-----------	------------

Supplementary Table S4 – General statistical information, including mean, standard deviation (SD), minimum (Min), maximum (Max) values, and number of observations (N), for different phytoplankton alpha diversity metrics, in the Ria Formosa lagoon, during the period September 2018 - September 2020. Significant differences between year seasons ($p < 0.05$), tested by Kruskal-Wallis rank test, followed by post-hoc pairwise comparisons, are also included. Asterisk symbols *, ** indicate p -value < 0.05 , and < 0.01 , respectively. ns: not significant.

Diversity metric	Season	Mean \pm SD	Min - Max	N	Differences between seasons
Species diversity	Autumn	1.7 \pm 0.3	1.2 - 2.5	14	ns
	Winter	1.8 \pm 0.3	1.1 - 2.3	12	
	Spring	1.8 \pm 0.4	0.8 - 2.5	15	
	Summer	1.4 \pm 0.5	0.6 - 2.2	21	
Species evenness	Autumn	0.6 \pm 0.1	0.4 - 0.7	14	Autumn*, Winter* and Spring* > Summer
	Winter	0.6 \pm 0.1	0.5 - 0.8	12	
	Spring	0.6 \pm 0.1	0.2 - 0.8	15	
	Summer	0.5 \pm 0.1	0.2 - 0.6	21	
Species richness	Autumn	19.4 \pm 7.9	8.0 - 34.0	14	ns
	Winter	20.0 \pm 8.2	10.0 - 32.0	12	
	Spring	25.0 \pm 7.2	15.0 - 41.0	15	
	Summer	24.5 \pm 7.5	11.0 - 41.0	21	
Species dominance	Autumn	63.3 \pm 11.1	39.4 - 81.5	14	ns
	Winter	63.9 \pm 13.2	41.2 - 88.3	12	
	Spring	62.6 \pm 14.7	37.3 - 90.3	15	
	Summer	72.5 \pm 14.8	47.9 - 95.5	21	

Supplementary Table S5 – Summary of PERMANOVA (permutational multivariate analysis of variance) tests evaluating differences in the structure of phytoplankton assemblages in the Ria Formosa lagoon (period: September 2018 - September 2020), considering station and season as factors, and results of pairwise comparisons for each factor. Sampling stations are located at 250 m (ALM 250), 750 m (ALM 750) and 1750 m (ALM 1750) from the discharge point of the Almargem wastewater treatment plant. df: degrees of freedom; SS: sum of squares; partial R^2 : partial coefficient of determination; Pseudo-F: pseudo-F ratio; P-val (perm): permutation P-value. Asterisk symbols *, **, *** indicate p-value <0.05, <0.01, and <0.001, respectively. ns: not significant.

Factor	df	SS	Partial R^2	Pseudo-F	P-val (perm)	Differences between ALM stations and seasons
Station	2	0.8	0.1	3.0	0.001	250 \neq 1750*** and 750 \neq 1750**
Season	3	2.4	0.2	6.3	0.001	Autumn \neq Winter** and all other comparisons***
Station x Season	6	0.6	0.1	0.8	0.933	ns

Supplementary Table S6 – Summary of the results of the similarity percentage (SIMPER) analysis, applied to the dissimilarity in the structure of phytoplankton assemblages for two sampling stations in the Ria Formosa lagoon (ALM 250 and ALM 1750), during the period September 2018 - September 2020. Phytoplankton taxa are listed in descending order of importance and, for each taxa, the mean abundance for the two stations ($\log(\text{cells L}^{-1} + 1)$), and the percentage contribution to the overall dissimilarity between stations (Contrib.) are provided. The cumulative percentage contribution (Cumulative contrib.), representing the sum of the individual contributions, shows how total dissimilarity is built up by the contributing species. Only the taxonomic entities that explained up to 70% of the cumulative dissimilarity are shown. Symbols next to each taxa represent different phytoplankton groups, including diatoms or specific phyla: ^Δ – Diatoms; [◊] – Dinoflagellata; [□] – Cyanobacteriota; ^{*} – Chlorophyta; ⁺ - Cryptista; [^] - Euglenophyta; [•] - Haptophyta.

SIMPER overall average dissimilarity = 59.1 %
