

# Supplementary Materials: Impact of Fertilizer N Application on the Grey Water Footprint of Winter Wheat in a NW-European Temperate Climate

Holger Brueck and Joachim Lammel

**Table S1.** Site-specific scores of environmental factors N deposition (N Dep.), texture, drainage, precipitation (Precip.) and scores of agricultural practices N fixation (N<sub>2</sub>-Fix.) and management (Managm.). Scores were multiplied with weight factors to calculate the leaching run-off factor  $\beta$ . For deviations from the proposed procedure of [14], see Material and methods, Section 2.4. Per factor a certain score (0 to 1) for the leaching-runoff potential is given. According to ref [14], a score of 0 indicates a very low leaching-runoff potential, a score 0.33 a low, a score 0.67 a high, and a score of 1 a very high leaching-runoff potential. A score of 0.5 is recommended if no information about the state of a factor can be obtained.

Site	N Dep.	Texture	Drainage	Precip.	N <sub>2</sub> -Fix.	Managm.	$\beta$
	Weight factors						
	0.10	0.25	0.25	0.15	0.10	0.15	
Scores							
1	1	0.67	0.67	0.33	0	0.33	0.464
