Abstract: We present several new results for fourth-order differential subordination and superordination in this paper by using the differential linear operator $\Gamma_{\pi,\rho,\beta,\mu}f(z)$. Relevant connections between the new results presented here and those considered in previous works are addressed. The properties and results concerning the differential subordination theory are symmetric to the properties obtained using the differential superordination theory, and by combining them, sandwich-type theorems are obtained.

Keywords: fourth-order differential subordination; admissible function; hadamard product; differential subordination; superordination; sandwich theorem; dominant; subordinate

MSC Classification: 30C45; 30C45

1. Introduction

The investigation conducted in this paper uses the well-known concepts of differential subordination and differential superordination. The concept of differential subordination introduced by Miller and Mocanu is presented in the monograph published in 2000 [1], and the concept of differential superordination was introduced by the same authors as dual concept to subordination in 2003 [2]. Third-order differential inequalities in the complex plane were considered in 1992 [3], and the concept of third-order differential subordination was introduced in 2011 by Antonino and Miller [4]. Further investigations were done on third-order differential subordination results for univalent analytic functions involving an operator in 2020 [5], and continuing the idea, the concept of fourth-order differential subordination was introduced and studied in 2020 [6,7]. Further results were published in 2021 [8] regarding the new concepts of higher-order differential subordinations. The present paper continues this study.

Interesting results were recently obtained regarding higher order differential subordination involving an operator [9–12], and other interesting results involving operators emerged as can be seen in papers published in 2020 [13–16] and 2021 [17–19]. These results motivated the introduction of the new operator, which will be presented at the end of this first section in Definition 1. and will be used in the next sections to obtain the original results regarding fourth-order differential subordinations and superordinations.

The usual environment provides the context for the present investigation. Well-known notations and definitions used for obtaining the original results are next presented.

 $\mathcal{K}(U^{\circ})$ denotes the family of analytic functions in U^{\circ} that have the form:

$$\mathcal{K}[\mathbf{a},\mathbf{n}] = \{ f \in \mathcal{K}(\mathbf{U}^\circ) : f(z) = a + a_{\mathbf{n}} z^{\mathbf{n}} + a_{\mathbf{n}+1} z^{\mathbf{n}+1} + \cdots \},\$$
$$a \in \mathbb{C}, \mathbf{n} \in N = \{1, 2, \dots\},\$$

and let \mathfrak{V}_n be the collection of the form:

$$\mathcal{U}_{\mathfrak{n}} = \{ f \in \mathcal{K}(U^{\circ}) : f(z) = z + a_{\mathfrak{n}+1} z^{\mathfrak{n}+1} + \cdots \},\$$

where $\mathcal{U}_1 = \mathcal{U}$, the subclass of normalized analytic functions in U°. Further, indicate by M the subfamily of $\mathcal{K}(U^\circ)$ of the form:

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n, z \in U^\circ,$$
(1)

which are univalent in U°. For analytic functions f and F, the function f is said to be subordinate to F, if

$$f(z) = F(\Theta(z)), (z \in U^{\circ}),$$

where $\Theta(z)$ is analytic and $\Theta(0) = 0$, $|\Theta(z)| < 1$. This subordination is indicated by f(z) < F(z).

Cho and Kim [20] proposed the multiplier transformation as a linear operator. Let \mathfrak{n} be any integer; the multiplier transformation $\mathcal{L}^{\beta}_{\mu}: M \to M$ is given by $\mathcal{L}^{\beta}_{\mu}f(z) = z + \sum_{\mathfrak{n}=2}^{\infty} \left(\frac{\mathfrak{n}+\mu}{1+\mu}\right)^{\beta} a_{\mathfrak{n}} z^{\mathfrak{n}}, \mu \geq 0, \beta \in \mathbb{Z} = \{\cdots, -1, 0, 1, \cdots\}.$

The Hurwitz-Lerch Zeta function [21] is

$$\zeta_{\pi,\rho}(z) = \frac{1}{\rho^{\pi}} + \sum_{n=1}^{\infty} \frac{z^n}{(n+\rho)^{\pi'}}$$

$$(\rho \in \mathbb{C} \setminus Z_o^- = \{0, -1, -2, ...\}, \pi \in \mathbb{C}, \text{ where } |z| < 1, \mathcal{R}e(\pi) > 1, z \in \partial U^\circ)$$

By making use of the following normalized function, we have:

$$G_{\pi,\rho}(z) = (1+\rho)^{\pi} [\zeta_{\pi,\rho}(z) - \rho^{-\pi}] = z + \sum_{n=2}^{\infty} \left(\frac{1+\rho}{n+\rho}\right)^{n} , z \in U^{\circ}.$$

If $f, g \in M$, where f given by (1) and g is defined by

$$g(z) = z + \sum_{n=2}^{\infty} b_n z^n$$
, $z \in U^\circ$,

then

$$(f * g)(z) = z + \sum_{n=2}^{\infty} a_n b_n z^n = (g * f)(z).$$

Using the convolution defined above, a new operator is next introduced as the original part of the present paper.

Definition 1. Assume $f \in M, z \in \partial U^{\circ}, \rho \in \mathbb{C} \setminus \mathbb{Z}_{o}^{-} = \{0, -1, -2, ...\}$, where $|z| < 1, \mathcal{R}e(\pi) > 1, \mu \ge 0, \beta \in \mathbb{Z}, \pi \in \mathbb{C}$; we define new operator $\Gamma_{\pi,\rho,\beta,\mu}f(z): M \to M$, where

$$\Gamma_{\pi,\rho,\beta,\mu}f(z) = G_{\pi,\rho(z)} * \mathcal{L}^{\beta}_{\mu}f(z) = z + \sum_{n=2}^{\infty} \left(\frac{1+\rho}{n+\rho}\right)^{\pi} \left(\frac{n+\mu}{1+\mu}\right)^{\beta} a_{n} z^{n}.$$
(2)

After a simple computation, we obtain the relation:

$$z\left(\Gamma_{\pi,\rho,\beta,\mu}f(z)\right)' = (1+\mu)\Gamma_{\pi,\rho,\beta+1,\mu}f(z) - \mu\Gamma_{\pi,\rho,\beta,\mu}f(z).$$
(3)

2. Problem Formulation

The subcollection of various analytic and univalent functions, which are connected to differential subordination and superordination in the open unit disk U°, has been initiated in recent times from a variety of intriguing outcomes and perspectives (cf. [7,22–28]). Additionally, several authors obtained good results on second- and third-order differential subordination; e.g., [29,30,31–34,35].

In order to demonstrate the original results, we will need the basic concepts of fourth-order theory previously introduced, which we present below showing the papers where they first appeared.

Definition 2. Ref. [4]: Assume that **Q** is called the set of functions **q** that are univalent and analytic on the set $\overline{U}^{\circ} \setminus E(\mathbf{q})$, where $E(\mathbf{q}) = \{\mathcal{J}: \mathcal{J} \in \partial U^{\circ} \text{ and } \lim_{z \to \mathcal{J}} \mathbf{q}(z) = \infty\}$ are such that $\min|\mathbf{q}'(\mathcal{J})| = \gamma > 0$ for $\mathcal{J} \in \partial U^{\circ} \setminus E(\mathbf{q})$. In addition, indicate by $\mathbf{Q}(a)$ the subclass of function **q** for which $\mathbf{q}(0) = a$. Note that $\mathbf{Q}_1 = \mathbf{Q}(1) = \{\mathbf{q}(z) \in \mathbf{Q}: \mathbf{q}(0) = 1\}$.

Definition 3. See [6,7]: Assume that k is univalent in U° and $\psi: \mathbb{C}^5 \times U^{\circ} \to \mathbb{C}$. If the analytic function p fulfills the fourth-order differential subordination

$$\psi(p(z), zp'(z), z^2 p''(z), z^3 p'''(z), z^4 p''''(z); z) \prec k(z), \tag{4}$$

then the function p is named a solution of the differential subordination (4). A univalent function \mathfrak{q} is named a dominant of the solutions of the differential subordination if $p \prec \mathfrak{q}$ for all psatisfying (4). A dominant $\tilde{\mathfrak{q}}(z)$ that fulfills $\tilde{\mathfrak{q}} \prec \mathfrak{q}$ for all dominants \mathfrak{q} of (4) is named the best dominant.

Definition 4. See [6,7]: Assume that $\mathbb{q} \in \mathbb{Q}$ and Ω is a set in \mathbb{C} . The admissible functions class $\Phi_n[\Omega, \mathbb{q}]$, $(\mathfrak{n} \in N \setminus \{2\})$ consists of those functions $\psi: \mathbb{C}^5 \times U^\circ \to \mathbb{C}$ that fulfill the following admissibility condition:

$$\psi(\mathfrak{r},\mathfrak{s},\mathfrak{t},\mathfrak{u},b;z)\notin\Omega,$$

wherever

$$\mathbf{r} = \mathbf{q}(\tau) , \qquad \mathbf{s} = \mathbf{m}\tau \mathbf{q}'(\tau) , \quad \mathcal{R}e\left(\frac{\mathbf{t}}{\mathbf{s}} + 1\right) \ge \mathbf{m}\mathcal{R}e\left(1 + \frac{\tau \mathbf{q}''(\tau)}{\mathbf{q}'(\tau)}\right),$$
$$e\mathcal{R}\left(\frac{\mathbf{u}}{\mathbf{s}}\right) \ge \mathbf{m}^{2}\mathcal{R}e\left(\frac{\tau^{2}\mathbf{q}'''(\tau)}{\mathbf{q}'(\tau)}\right) , e\mathcal{R}\left(\frac{b}{s}\right) \ge \mathbf{m}^{3}\mathcal{R}e\left(\frac{\tau^{3}\mathbf{q}''''(\tau)}{\mathbf{q}'(\tau)}\right),$$
$$(z \in U^{\circ}, \tau \in \partial U^{\circ} \setminus \mathbf{E}(\mathbf{q}) \text{ and } \mathbf{m} \ge \mathbf{n}).$$

Theorem 1. See [7]: Let $p \in \mathcal{K}[a, n]$, $(n \in N \setminus \{2\})$. In addition, let $\mathfrak{q} \in \mathfrak{Q}$ and fulfill the conditions:

$$\mathcal{R}e\left(\frac{\tau^2 \mathfrak{q}^{\prime\prime\prime}(\tau)}{\mathfrak{q}^{\prime}(\tau)}\right) \ge 0, \quad \left|\left(\frac{z^2 p^{\prime\prime}(\tau)}{\mathfrak{q}^{\prime}(\tau)}\right)\right| \le \mathfrak{m}^2,\tag{5}$$

where $z \in U^{\circ}, \tau \in \partial U^{\circ} \setminus E(\mathbb{q})$ and $\mathfrak{m} \geq \mathfrak{n}$. If $\psi \in \Phi_{\mathfrak{n}}[\Omega, \mathfrak{q}], \Omega$ is a set in \mathbb{C} and $\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z) \in \Omega$, then $p(z) \prec \mathfrak{q}(z), z \in U^{\circ}$.

Definition 5. See [6,7]: Assume that $\psi: \mathbb{C}^5 \times U^\circ \to \mathbb{C}$ and k is an analytic function in U° . If p(z) and

$$\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z)$$

are univalent in U° and satisfy the fourth-order differential superordination

$$k(z) \prec \psi(p(z), zp'(z), z^2 p''(z), z^3 p'''(z), z^4 p''''(z); z),$$
(6)

then p(z) is called a solution of the differential superordination. An analytic function q(z) is denoted a subordinate of the solutions of the differential superordination or more simply a subordinate if q(z) < p(z) for all p(z) satisfying (6). A univalent subordinate $\tilde{q}(z)$ that satisfies the condition $q(z) < \tilde{q}(z)$ for all subordinates q(z) of (6) is referred to as the best subordinate. We note that the best subordinate is unique up to a rotation of U° .

Definition 6. See [6,7]: Assume $\mathfrak{q}(z) \in \mathcal{K}[a,\mathfrak{n}]$, $\mathfrak{q}'(z) \neq 0$ and Ω is a set in \mathbb{C} . The class of admissible functions $\Phi'_{\mathfrak{n}}[\Omega,\mathfrak{q}]$ consists of those functions:

$$\psi \colon \mathbb{C}^5 \times \overline{U} \to \mathbb{C}$$

that satisfy the following admissibility condition:

$$\Psi(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) \notin \Omega$$

wherever

 $\mathfrak{r} = \mathfrak{q}(z) , \qquad \mathfrak{s} = \frac{1}{\kappa} z \mathfrak{q}'(\tau) , \quad \mathcal{R}e(\frac{\mathfrak{t}}{\mathfrak{s}} + 1) \ge \frac{1}{\kappa} \mathcal{R}e\left(\frac{z \mathfrak{q}''(z)}{\mathfrak{q}'(z)} + 1\right)$

and

$$e\mathcal{R}\left(\frac{\mathfrak{u}}{\mathfrak{s}}\right) \geq \frac{1}{\kappa^2} \mathcal{R}e\left(\frac{\tau^2\mathfrak{q}^{\prime\prime\prime\prime}(z)}{\mathfrak{q}^{\prime}(z)}\right), \ e\mathcal{R}\left(\frac{\mathfrak{t}}{\mathfrak{s}}\right) \geq \frac{1}{\kappa^3} \mathcal{R}e\left(\frac{\tau^3\mathfrak{q}^{\prime\prime\prime\prime\prime}(z)}{\mathfrak{q}^{\prime}(z)}\right),$$

where $\tau \in \partial U^{\circ}$, $z \in U^{\circ}$ and $\kappa \geq n \geq 3$.

Theorem 2. See [6,7]: Assume that $\psi \in \Phi'_{\mathfrak{n}}[\Omega, \mathfrak{q}]$ and $\mathfrak{q}(z) \in \mathcal{K}[a, \mathfrak{n}]$. If

$$\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z)$$

is univalent in U° and $p(z) \in \mathbb{Q}(a)$ satisfy the conditions

$$\mathcal{R}e\left(\frac{z^2 \mathbf{q}^{\prime\prime\prime}(z)}{\mathbf{q}^\prime(z)}\right) \ge 0 , \quad \left| \left(\frac{z^2 \mathbf{q}^{\prime\prime}(z)}{\mathbf{q}^\prime(z)}\right) \right| \le \frac{1}{\kappa^2},$$

 $z \in U^{\circ}, \tau \in \partial U^{\circ}$, and $\kappa \geq n \geq 3$, then where

 $\Omega \subset \{(\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z), \quad z \in U^\circ)\}$ thus, $q(z) \prec p(z), z \in U^\circ.$

Using those known definitions and results, in the next two sections, we prove new fourth-order differential subordination and superordination results involving the operator introduced in Definition 1. Further, in the last section of the paper, we combine the results for obtaining a sandwich-type theorem.

3. Fourth-Order Differential Subordination Results Using the Operator $\Gamma_{\pi,\rho,\beta,\mu}f(z)$

We give the class of admissible functions, which is required in proving differential subordination theorems using the operator $\Gamma_{\pi,\rho,\beta,\mu}f(z)$ given by (2).

Definition 7. Assume $\mathbf{q} \in \mathbf{Q}_1 \cap \mathcal{K}_1$ and Ω is a set in \mathbb{C} . Let $\theta_{\Gamma}[\Omega, \mathbf{q}]$ be the class of admissible functions that consists of those functions $Y: \mathbb{C}^5 \times U^\circ \to \mathbb{C}$ that satisfy the following admissibility condition:

$$\Upsilon(\mathbf{r}, \mathbf{s}, \mathbf{x}, \mathbf{y}, \mathbf{g}, z) \notin \Omega,$$

 $\mathfrak{mJ}\mathfrak{q}'(\tau \mathcal{J}) + \mu \mathfrak{q}(z)$

wherever

$$\mathbf{r} = \mathbf{q}(\mathcal{J}) , \qquad \mathbf{s} = \frac{\mathbf{m}\mathcal{J}\mathbf{q}(\mathcal{I}\mathcal{J}) + \mu\mathbf{q}(\mathcal{Z})}{1+\mu},$$
$$\mathcal{R}e\left\{\frac{(1+\mu)^{2}\mathbf{x} - \mu^{2}\mathbf{r}}{(1+\mu)\mathbf{s} - \mu\mathbf{r}} - 2\mu\right\} \ge \mathbf{m}\mathcal{R}e\left\{\frac{\mathcal{J}\mathbf{q}''(\mathcal{J})}{\mathbf{q}'(\mathcal{J})} + 1\right\},$$
$$\mathcal{R}e\left\{\frac{(1+\mu)^{2}[(1+\mu)\mathbf{y} - (3+3\mu)\mathbf{x}] + (3\mu^{2} + 2\mu^{3})\mathbf{r}}{(1+\mu)\mathbf{s} - \mu\mathbf{r}} + (2+6\mu+3\mu^{2})\right\} \ge \mathbf{m}^{2}\mathcal{R}e\left\{\frac{\mathcal{J}^{2}\mathbf{q}'''(\mathcal{J})}{\mathbf{q}'(\mathcal{J})}\right\},$$
and

$$\mathcal{R}e\left\{\frac{(1+\mu)[(1+\mu)^{3}\mathbb{g}-(1+\mu)^{2}(6+4\mu)\mathbb{y}+(1+\mu)(11+18\mu+8\mu^{2})\mathbb{x}}{(1+\mu)\mathbb{s}+\mu\mathbb{r}}\right.$$
$$\frac{-(6\mathbb{s}+22\mu+18\mu^{2}+8\mu^{3}]+(6\mu+11\mu^{2}+6\mu^{3}+3\mu^{4})\mathbb{s}}{(1+\mu)\mathbb{s}+\mu\mathbb{r}}\right\} \ge \mathbb{m}^{3}\mathcal{R}e\left\{\frac{\mathcal{J}^{3}\mathbb{q}^{\prime\prime\prime\prime\prime}(\mathcal{J})}{\mathbb{q}^{\prime}(\mathcal{J})}\right\},$$

where $z \in U^{\vee}, \mu \in \partial U^{\vee} \setminus E(\mathfrak{q}), \mu > -1 \text{ and } \mathfrak{m} \geq 3$.

Theorem 3. Assume that $Y \in \theta_{\Gamma}[\Omega, \mathbb{q}]$. If $f \in \mathfrak{V}$ and $\mathbb{q} \in \mathbb{Q}_1$ satisfy the following conditions:

$$\mathcal{R}e\left(\frac{\mathcal{J}^{2}\mathfrak{q}^{\prime\prime\prime}(\mathcal{J})}{\mathfrak{q}^{\prime}(\mathcal{J})}\right) \ge 0, \quad \left|\left(\frac{\Gamma_{\pi,\rho,\beta,\mu}f(z)}{\mathfrak{q}^{\prime}(\mathcal{J})}\right)\right| \le \mathfrak{m}^{2}$$

$$\tag{7}$$

and

$$\left\{ \Upsilon \big(\Gamma_{\pi,\rho,\beta,\mu} f(z), \Gamma_{\pi,\rho,\beta+1,\mu} f(z), \Gamma_{\pi,\rho,\beta+2,\mu} f(z), \Gamma_{\pi,\rho,\beta+3,\mu} f(z), \Gamma_{\pi,\rho,\beta+4,\mu} f(z) \right) : z \in U^{\circ} \right\} \subset \Omega, \tag{8}$$

then $\Gamma_{\pi,\rho,\beta,\mu} f(z) \prec \operatorname{q}(z), z \in U^{\circ}.$

Proof:

Put
$$p(z) = \Gamma_{\pi,\rho,\beta,\mu}f(z)$$
 (9)

Now, by differentiating (9) with respect to z and by applying (3), we obtain:

$$\Gamma_{\pi,\rho,\beta+1,\mu}f(z) = \frac{zp'(z) + \mu p(z)}{(1+\mu)}.$$
(10)

Further computations show that

$$\Gamma_{\pi,\rho,\beta+2,\mu}f(z) = \frac{z^2 p''(z) + (12\mu + 1)zp'(z) + \mu^2 p(z)}{(1+\mu)^2},$$
(11)

$$\Gamma_{\pi,\rho,\beta+3,\mu}f(z) = \frac{\mu^3 p^{\prime\prime\prime}(z) + (3+3\mu)z^2 p^{\prime\prime}(z) + (1+3\mu+3\mu^2)z p^{\prime}(z) + \mu^3 p(z)}{(1+\mu)^4}$$
(12)

and

f(-)

п

$$=\frac{z^4 p^{\prime\prime\prime\prime}(z) + (6+4\mu)z^3 p^{\prime\prime\prime}(z) + (7+12\mu+4\mu^2)z^2 p^{\prime\prime}(z) + (1+4\mu+4\mu^2+4\mu^3)z p^{\prime}(z) + \mu^4 p(z)}{(1+\mu)^4}.$$
(13)

Now, we present the transformation from \mathbb{C}^5 to \mathbb{C} by

$$\mathbb{r}(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \mathbf{r}, \qquad \mathbb{s}(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \frac{\mathbf{s} + \mu \mathbf{r}}{1 + \mu},$$
$$\mathbb{x}(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \frac{\mathbf{t} + (1 + 2\mu)\mathbf{s} + \mu^{2}\mathbf{r}}{(1 + \mu)^{2}},$$
$$\mathbb{y}(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \frac{\mathbf{u} + (3 + 3\mu)\mathbf{t} + (1 + 3\mu + 3\mu^{2})\mathbf{s} + \mu^{3}\mathbf{r}}{(1 + \mu)^{3}},$$

and

$$g(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \frac{b + (4\mu + 6)\mathbf{u} + (4\mu^2 + 12\mu + 7)\mathbf{t} + (4\mu^3 + 4\mu^2 + 4\mu + 1)\mathbf{s} + \mu^4\mathbf{r}}{(1+\mu)^4}.$$
(14)

Assume

$$\psi(\mathbf{r}, \mathbf{s}, \mathbf{t}, \mathbf{u}, b; z) = \Upsilon(\mathbf{r}, \mathbf{s}, \mathbf{x}, \mathbf{y}, \mathbf{g}, z),$$

$$= \Upsilon(\mathbf{r}, \frac{\mathbf{s} + \mu \mathbf{r}}{1 + \mu}, \frac{\mathbf{t} + (1 + 2\mu)\mathbf{s} + \mu^{2}\mathbf{r}}{(1 + \mu)^{2}}, \frac{\mathbf{u} + (3 + 3\mu)\mathbf{t} + (1 + 3\mu + 3\mu^{2})\mathbf{s} + \mu^{3}\mathbf{r}}{(1 + \mu)^{3}},$$

$$\frac{b + (6 + 4\mu)\mathbf{u} + (7 + 12\mu + 4\mu^{2})\mathbf{t} + (1 + 4\mu + 4\mu^{2} + 4\mu^{3})\mathbf{s} + \mu^{4}\mathbf{r}}{(1 + \mu)^{4}}; z).$$
(15)

We conclude the proof by using Theorem 1, and by using Equation (9) in (13), we obtain from (15) that

$$(\psi(p(z), zp'(z), z^2 p''(z), z^3 p'''(z), z^4 p''''(z); z) =$$
(16)

$$\Upsilon(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z);z).$$

Therefore, (8) transforms into

 $\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z) \in \Omega,$

and we observe that

$$\frac{t}{s} + 1 = \frac{(1+\mu)^2 x - \mu^2 r}{(1+\mu)s - \mu r} - 2\mu,$$

$$\frac{u}{5} = \frac{(1+\mu)^2[(1+\mu)y-(3+3\mu)x]+(3\mu^2+2\mu^3)r}{(1+\mu)s-\mu r} + (2+6\mu+3\mu^2),$$

and

 $\frac{b}{s} = \frac{(1+\mu)[(1+\mu)^3 g - (1+\mu)^2 (6+4\mu)y + (1+\mu)(11+18\mu+8\mu^2)x - (6+22\mu+18\mu^2+8\mu^3)s] + (6\mu+11\mu^2+6\mu^3+3\mu^4)r}{(1+\mu)s - \mu r}.$

Hence, we have the equivalent of the admissibility condition for $\theta_{\Gamma}[\Omega, \mathbb{q}]$ in Definition 7 with the admissibility condition for $\psi \in \Phi_{\pi}[\Omega, \mathbb{q}]$ as known in Definition 4, $\pi = 3$. Thus, by using Theorem 1 with Equation (7), we have $p(z) = \Gamma_{\pi,\rho,\beta,\mu}f(z) \prec \mathbb{q}(z)$.

The below corollary is the extension of the above theorem for the case where the action of q(z) on ∂U° is unknown.

Corollary 1. Assume the function $\mathfrak{q}(z)$ is univalent in U° with $\mathfrak{q}(0) = 1$ and $\Omega \subset \mathbb{C}$. Assume $Y \in \theta_{\Gamma}[\Omega, \mathfrak{q}_{\gamma}]$ for some $\gamma \in (0,1)$, such that $\mathfrak{q}_{\gamma}(z) = \mathfrak{q}(\gamma z)$. If the function $f(z) \in \mathfrak{V}$ and $\mathfrak{q}_{\gamma}(z)$ satisfy the following conditions:

$$\mathcal{R}e\left(\frac{\mathcal{J}^{2}\mathfrak{q}^{\prime\prime\prime}(z)}{\mathfrak{q}^{\prime}(z)}\right) \ge 0, \left|\left(\frac{\varGamma_{\pi,\rho,\beta+2,\mu}f(z)}{\mathfrak{q}^{\prime}(z)}\right)\right| \le \mathfrak{m}^{2}, (z \in U^{\circ}, \mathcal{J} \in \partial U^{\circ} \setminus E(\mathfrak{q}_{\gamma}))$$
(17)

and

 $\left\{\Upsilon\left(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z)\right):z\in U^{\circ}\right\}\subset\Omega.$

Then

$$\Gamma_{\pi,\rho,\beta,\mu}f(z) \prec \mathfrak{q}(z), z \in U^{\circ}.$$

Proof. By applying the theorem above, we have $\Gamma_{\pi,\rho,\beta,\mu}f(z) \prec \mathfrak{q}_{\gamma}(z)$. Then, we have the result from $\mathfrak{q}_{\nu}(z) \prec \mathfrak{q}(z), z \in U^{\circ}$. If $\Omega \neq \mathbb{C}$ is a simply connected domain, then $\Omega =$ $\mathscr{R}(U^{\circ})$ considering a conformal mapping $\mathscr{R}(z)$ of U° onto Ω . In this case, the class $\theta_{\Gamma}[\&(U^{\circ}), \mathbb{q}]$ can be written as $\theta_{\Gamma}[\&, \mathbb{q}]$. \Box

Now, we obtain the next two results from the above theorem and corollary.

Theorem 4. Assume that $Y \in \theta_{\Gamma}[k, q]$, if $q \in Q_1$ and $f \in \mathcal{V}$ fulfills the condition (7) and $Y\big(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z);z\big) \prec \mathscr{k}(z),$ (18)then $\Gamma_{\pi,\rho,\beta,\mu}f(z) \prec q(z), z \in U^{\circ}$.

> **Corollary 2.** Assume the function $\mathfrak{q}(z)$ is a univalent in $U^{\circ}, \mathfrak{q}(0) = 1$ and $\Omega \subset \mathbb{C}$. Assume $Y \in \mathbb{C}$ $\theta_{\Gamma}[k, \mathbf{q}_{\gamma}]$ for several $\gamma \in (0,1)$, such that $\mathbf{q}_{\gamma}(z) = \mathbf{q}(\gamma z)$. If \mathbf{q}_{γ} satisfies the condition (17), $f \in \mathcal{V}$ and

 $\Upsilon\big(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z);z) \prec \mathscr{K}(z),$ (19)then

$$\Gamma_{\pi,\rho,\beta,\mu}f(z) \prec \mathfrak{q}(z), z \in U^{\circ}.$$

Now, the next theorem gives the best dominant of the differential subordination (18).

Theorem 5. Suppose $\Upsilon: \mathbb{C}^5 \times U^{\circ} \to \mathbb{C}$; also assume the function k is univalent in U° , and the differential equation

$$Y\left(q(z), \frac{zq'(z) + \mu q(z)}{1 + \mu}, \frac{z^2q''(z) + (1 + 2\mu)zq'(z) + \mu^2 q(z)}{(1 + \mu)^2}, \frac{z^3q''(z) + (3 + 3\mu)z^2q''(z) + (1 + 3\mu + 3\mu^2)zq'(z) + \mu^3 q(z)}{(1 + \mu)^3}, \frac{z^4q''''(z) + (6 + 4\mu)z^3q'''(z) + (1 + \mu)q'}{(1 + \mu)^4}\right)$$

$$\frac{(7 + 12\mu + 4\mu^2)z^2q''(z) + (1 + 4\mu + 4\mu^2 + 4\mu^3)zq'(z) + \mu^4 q(z);z}{(1 + \mu)^4} = \&(20)$$

has a solution $\mathfrak{q}(z)$ with $\mathfrak{q}(0) = 1$ and $\mathfrak{q}(z)$ verifies Equation (7). If the function $f \in M$ satisfies condition (18) and

$$\Upsilon\big(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z);z)$$

is analytic in U°, then

 $\Gamma_{\pi,\rho,\beta,\mu}f(z) \prec q(z)$, and q(z) is the best dominant.

Proof. By applying Theorem 3, it can be shown that q(z) is a dominant of equation (18), because $\mathfrak{q}(z)$ satisfies (20), so that $\mathfrak{q}(z)$ is a solution of (18) and hence $\mathfrak{q}(z)$ will be dominant of all dominants; therefore q(z) will be the best dominant. \Box

Now, we put $\mathfrak{q}(z) = \mathbb{M}z, \mathbb{M} > 0$, and using Definition 7, the class of admissible functions $\theta_{\Gamma}[\Omega, \mathbb{q}]$, denoted by $\theta_{\Gamma}[\Omega, \mathbb{M}]$, is given below.

Definition 8. Assume that $\mathbb{M} > 0$ and that Ω is a set in \mathbb{C} . The class of admissible functions $\theta_{\Gamma}[\Omega, \mathbb{M}]$ consists of those functions $\Upsilon: \mathbb{C}^5 \times U^{\circ} \to \mathbb{C}$ that satisfy the admissibility condition:

$$\Upsilon\left(\mathbb{M}e^{i\vartheta}, \frac{\mathbb{k}+\mu}{1+\mu}\mathbb{M}e^{i\vartheta}, \frac{\mathbb{L}+[(2\mu+1)\mathbb{k}+\mu^{2}]\mathbb{M}e^{i\vartheta}}{(1+\mu)^{2}}, \frac{\mathbb{N}+(3\mu+3)\mathbb{L}+[3\mu^{2}+3\mu+1)\mathbb{k}+\mu^{3}}{(1+\mu)^{3}}, \frac{\mathbb{A}+(4\mu+6)\mathbb{N}+(4\mu^{2}+12\mu+7)\mathbb{L}+[(4\mu^{3}+4\mu^{2}+4\mu+1)\mathbb{k}+\mu^{4}]\mathbb{M}e^{i\vartheta}}{(1+\mu)^{4}}; z\right) \notin \Omega,$$
(21)

such that $1 > -\mu$, $z \in U^{\circ}$, $\mathcal{R}e(\mathbb{L}e^{-i\vartheta}) \ge (\mathbb{k} - 1)\mathbb{k}\mathbb{M}$, $\mathcal{R}e(\mathbb{N}e^{-i\vartheta}) \ge 0$ and $\mathcal{R}e(\mathbb{A}e^{-i\vartheta}) \ge 0$ for all $\vartheta \in R$ and $\mathbb{k} \ge 3$.

Theorem 6. Assume that $Y \in \theta_{\Gamma}[\Omega, \mathbb{M}]$. If $f \in M$ fulfills the conditions: $|\Gamma_{\pi,\rho,\beta+2,\mu}f(z)| \leq \mathbb{R}^2 \mathbb{M}$, $\mathbb{R} \geq 3$, $\mathbb{M} > 0$, and

$$Y\big(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z);z)\in\Omega_{\mathcal{A}}$$

then $|\Gamma_{\pi,\rho,\beta,\mu}f(z)| < \mathbb{M}$. Now, taking $\Omega = \mathbb{q}(U^{\circ}) = \{w: |w| < M\}$, the class $\theta_{\Gamma}[\Omega, \mathbb{M}]$ is simply denoted by $\theta_{\Gamma}[\mathbb{M}]$.

Theorem 7. Assume $\mathbb{k} \geq 3$, $\mathbb{M} > 0$, $\mu > -1$. If $f \in M$ satisfies the conditions $|\Gamma_{\pi,\rho,\beta+2,\mu}f(z)| \leq \mathbb{k}^2 \mathbb{M}$, and $|(1+\mu)^4 \Gamma_{\pi,\rho,\beta+4,\mu}f(z) - \mu(1+\mu)^3 \Gamma_{\pi,\rho,\beta+3,\mu}f(z)| < (|1+3\mu+\delta\mu^2+\mu^3|+2|7+9\mu+\mu^2|)3\mathbb{M}$, then $|\Gamma_{\pi,\rho,\beta,\mu}f(z)| < \mathbb{M}$.

Proof: Assume that $\Upsilon(\mathbf{r}, \mathbf{s}, \mathbf{x}, \mathbf{y}, \mathbf{g}, z) = (1 + \mu)^4 \mathbf{g} - \mu (1 + \mu)^3 \mathbf{y}$, $\Omega = \Re(U^\circ)$, such that

$$k(z) = (|1+3\mu+\mu^2+\mu^3|+2|7+9\mu+\delta\mu^2|)3Mz$$
 , $M > 0$

Now, by applying Theorem 6, we show that $Y \in \theta_{\Gamma,1}[\Omega, M]$. Because $\begin{vmatrix} Y(Me^{i\vartheta}, \frac{\mathbb{k} + \mu}{1 + \mu} Me^{i\vartheta}, \frac{\mathbb{L} + [(2\mu + 1)\mathbb{k} + \mu^2]Me^{i\vartheta}}{(1 + \mu)^2}, \frac{\mathbb{N} + (3 + 3\mu)\mathbb{L} + [1 + 3\mu + 3\mu^2)\mathbb{k} + \mu^3}{(1 + \mu)^3}, \\ \frac{\mathbb{A} + (6 + 4\mu)\mathbb{N} + (7 + 12\mu + 4\mu^2)\mathbb{L} + [(1 + 4\mu + 4\mu^2 + 4\mu^3)\mathbb{k} + \mu^4]Me^{i\vartheta}}{(1 + \mu)^4}; z) \end{vmatrix}$ $= \left| \mathbb{A} + (6 + 3\mu)\mathbb{N} + (7 + 9\mu + \mu^2)\mathbb{L} + (1 + 3\mu + \mu^2 + \mu^3)\mathbb{k}Me^{i\vartheta} \right|$ $= \left| \mathbb{A} e^{-i\vartheta} + (6 + 3\mu)\mathbb{N} e^{-i\vartheta} + (7 + 9\mu + \mu^2)\mathbb{L}e^{-i\vartheta} + (1 + 3\mu + \mu^3)\mathbb{k}M \right|$ $\geq \mathcal{R}e(\mathbb{A}e^{-i\vartheta}) + \left| (6 + 3\mu)\mathbb{R}e(\mathbb{N}e^{-i\vartheta}) + |(7 + 9\mu + \mu^2)\mathbb{L}e^{-i\vartheta} + |(1 + 3\mu + \mu^2 + \mu^3)\mathbb{k}M, \\ \ge \left| (1 + 3\mu + \mu^2 + \mu^3)\mathbb{k}M + 2|(7 + 9\mu + \mu^2)\mathbb{k}(\mathbb{k} - 1)M \right|$ $\geq (\left| (1 + 3\mu + \mu^2 + \mu^3)\mathbb{k}M + 2|(7 + 9\mu + \mu^2)\mathbb{k}(\mathbb{k} - 1)M \right|$ such that $\mathcal{R}e(\mathbb{A}e^{-i\vartheta}) \ge 0, \mathcal{R}e(\mathbb{N}e^{-i\vartheta}) \ge 0 \text{ and } \mathcal{R}e(\mathbb{L}e^{-i\vartheta}) \ge (\mathbb{k} - 1)\mathbb{k}Ma$ for all $\vartheta \in \mathbb{R}, z \in U^{\circ} and \mathbb{k} \ge 3.$ The proof is complete. □

4. Fourth-Order Differential Superordination Results Using the Operator $\Gamma_{\pi,\rho,\beta,\mu}f(z)$:

In this section, we introduce fourth-order differential superordination by using $\Gamma_{\pi,\rho,\beta,\mu}f(z)$ defined by (2). For this main aim, the class of admissible functions is given by the definition below:

Definition 9. Assume $q'(z) \neq 0, q \in \mathcal{K}_1$ and let Ω be a set in \mathbb{C} . The admissible class $Y'_{\Gamma}[\Omega, q]$ consists of those functions $Y: \mathbb{C}^5 \times \overline{U}^{\circ} \to \mathbb{C}$ that satisfy the admissibility condition

$$\Upsilon(\mathbf{r}, \mathbf{s}, \mathbf{x}, \mathbf{y}, \mathbf{g}; \mathcal{J}) \in \Omega,$$

where

$$\mathbb{r} = \mathbb{q}(z)$$
 , $\mathbb{s} = \frac{z \mathcal{J} \mathbb{q}'(z) + \mathfrak{m} \mathbb{q}(z)}{(1+\mu)\mathfrak{m}}$

$$\begin{aligned} &\mathcal{R}e\left\{\frac{(1+\mu)^{2}\mathbf{x}-\mu^{2}\mathbf{r}}{(1+\mu)\mathbf{s}-\mu\mathbf{r}}-2\mu\right\} \geq \frac{1}{\mathbf{m}}\mathcal{R}e\left\{\frac{z\mathbf{q}''(z)}{\mathbf{q}'(z)}+1\right\},\\ &\mathcal{R}e\left\{\frac{(1+\mu)^{2}[(1+\mu)\mathbf{y}-(3+3\mu)\mathbf{x}]+(3\mu^{2}+2\mu^{3})\mathbf{r}}{(1+\mu)\mathbf{s}-\mu\mathbf{r}}+(2+6\mu+3\mu^{2})\right\} \geq \frac{1}{\mathbf{m}^{2}}\mathcal{R}e\left\{\frac{z^{2}\mathbf{q}''(z)}{\mathbf{q}'(z)}\right\},\\ &\text{and}\\ &\mathcal{R}e\left\{\frac{(1+\mu)[(1+\mu)^{3}\mathbf{g}-(1+\mu)^{2}(6+4\mu)\mathbf{y}+(1+\mu)(11+18\mu+8\mu^{2})\mathbf{x}]}{(1+\mu)\mathbf{s}+\mu\mathbf{r}}-\frac{-(6+22\mu+18\mu^{2}+8\mu^{3})\mathbf{s}]+(6\mu+11\mu^{2}+6\mu^{3}+3\mu^{4})\mathbf{r}}{(1+\mu)\mathbf{s}+\mu\mathbf{r}}\right\} \geq \frac{1}{\mathbf{m}^{3}}\mathcal{R}e\left\{\frac{z^{3}\mathbf{q}''''(z)}{\mathbf{q}'(z)}\right\},\\ &\text{where } z\in U^{\circ}, \mathcal{J}\in\partial U^{\circ}, \mu\in\mathbb{C}\backslash Z_{0}^{-}, Z_{0}^{-}=\{0,-1,-2,\ldots\} and \mathbf{m}\geq 3.\end{aligned}$$

Theorem 8. Assume that $Y \in \theta'_{\Gamma}[\Omega, \mathbb{q}]$. If $f \in M$ and $\Gamma_{\pi,\rho,\beta,\mu}f(z) \in \mathbb{Q}_1$ satisfy the conditions

$$\mathcal{R}e\left(\frac{z^2 \mathfrak{q}^{\prime\prime\prime}(z)}{\mathfrak{q}^{\prime}(z)}\right) \ge 0, \quad \left|\left(\frac{\Gamma_{\pi,\rho,\beta,\mu}f(z)}{\mathfrak{q}^{\prime}(z)}\right)\right| \le \frac{1}{\mathfrak{m}^2}$$
(22)

and

$$\left\{\Upsilon\left(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z)\right): z \in U^{\circ}\right\}$$

is univalent in U° , and

 $\Omega \subset \{\Upsilon(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z); z \in U^{\circ})\},$ (23) $then \ \mathfrak{q}(z) \prec \Gamma_{\pi,\rho,\beta,\mu}f(z).$

Proof. Define the functions p(z) and ψ by (9) and (15), respectively. We have $\Upsilon \in \theta'_{\Gamma}[\Omega, \mathbb{q}]$. Therefore, from (16) and (23), we obtain

 $\mathcal{\Omega} \subset \{ \psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z \in U^\circ) \}.$

Now, from Equation (14), note that the admissibility condition for $\Upsilon \in \theta'_{\Gamma}[\Omega, \mathbb{q}]$ in Definition 9 is the admissibility condition for ψ as defined in Definition 6 with $\mathfrak{n} = 3$.

Therefore, by applying (7) and Theorem 2 and knowing $\psi \in \theta'_{\Gamma}[\Omega, \mathbb{q}]$, we obtain $\mathbb{q}(z) \prec p(z) = \Gamma_{\pi,\rho,\beta,\mu}f(z)$.

Hence, the proof of theorem is complete. \Box

Now, if $\Omega = \mathscr{k}(U^{\circ})$ for a conformal mapping $\mathscr{k}(z)$ of U° onto Ω and if $\Omega \neq \mathbb{C}$ is a simply connected domain then the class $\theta'_{\Gamma}[\mathscr{k}(U^{\circ}), \mathbb{q}]$ is written as $\theta'_{\Gamma}[\mathscr{k}, \mathbb{q}]$.

The below theorem is direct consequence of the theorem above.

Theorem 9. Consider the analytic function &(z) in U° and $\Upsilon \in \theta'_{\Gamma}[\&(U^{\circ}), \mathbb{q}]$. If $f \in M, \Gamma_{\pi,\rho,\beta,\mu}f(z) \in \mathbb{Q}_1$ and $\mathbb{q} \in \mathcal{K}_1$ satisfies the condition (22),

 $\left\{ \Upsilon \left(\Gamma_{\pi,\rho,\beta,\mu} f(z), \Gamma_{\pi,\rho,\beta+1,\mu} f(z), \Gamma_{\pi,\rho,\beta+2,\mu} f(z), \Gamma_{\pi,\rho,\beta+3,\mu} f(z), \Gamma_{\pi,\rho,\beta+4,\mu} f(z) \right) : z \in U^{\circ} \right\}$

is univalent in U°, and

$$\&(z) \subset \{ \Upsilon \big(\Gamma_{\pi,\rho,\beta,\mu} f(z), \Gamma_{\pi,\rho,\beta+1,\mu} f(z), \Gamma_{\pi,\rho,\beta+2,\mu} f(z), \Gamma_{\pi,\rho,\beta+3,\mu} f(z), \Gamma_{\pi,\rho,\beta+4,\mu} f(z); z \in U^{\circ}) \},$$

$$then \ \mathfrak{q}(z) \prec \Gamma_{\pi,\rho,\beta,\mu} f(z).$$

$$(24)$$

Proof. The proof of theorem is similar to that of Theorem 3 and is omitted here. \Box

Theorem 10. Assume that $\Upsilon: \mathbb{C}^5 \times \overline{U}^{\circ} \to \mathbb{C}$, the function $\mathscr{K}(z)$ is analytic in U° , and ψ is defined by (15). Assume that the differential equation

$$\{\psi(p(z), zp'(z), z^2p''(z), z^3p'''(z), z^4p''''(z); z \in U^\circ)\} = \mathscr{K}(z),$$
(25)

has a solution $\mathfrak{q}(z) \in \mathfrak{Q}_1$. If $\Gamma_{\pi,\rho,\beta,\mu}f(z) \in \mathfrak{Q}_1, \mathfrak{q} \in \mathcal{K}_1$, $\mathfrak{q}'(z) \neq 0$ and $f \in M$ satisfy the conditions (7) and (22),

$$\left\{Y\left(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z)\right):z\in U^{\circ}\right\}$$

is univalent in U°, and

$$\mathscr{K}(z) \subset \{\Upsilon(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z); z \in U^{\check{}})\}$$

then $q(z) \prec \Gamma_{\pi,\rho,\beta,\delta}f(z)$, and q(z) is the best subordinate of (24).

Proof. The proof of theorem is similar to that of Theorem 5 and is omitted here. \Box

5. Sandwich-Type Results

Now, by using Theorems 5 and 9, we have the sandwich-type result.

Theorem 11. Consider two analytic functions $\&k_1(z)$ and $\[mathbb{q}_1(z)$ in U° , and $\[mathbb{q}_2(z) \in \[mathbb{Q}_1$ with $\[mathbb{q}_1(0) = \[mathbb{q}_2(0) = 1\]$. In addition let the function $\&k_2(z)$ be univalent in U° and $Y \in \[mathbb{\theta}_{\Gamma}[\&k_2,\[mathbb{q}_2]] \cap \[mathbb{\theta}_{\Gamma}[\&k_1,\[mathbb{q}_1]\]$. If $\[mathbb{\Gamma}_{\pi,\rho,\beta,\mu}f(z) \in \[mathbb{Q}_1 \cap \mathcal{K}, f \in M,$

$$\left\{ \Upsilon \left(\Gamma_{\pi,\rho,\beta,\mu} f(z), \Gamma_{\pi,\rho,\beta+1,\mu} f(z), \Gamma_{\pi,\rho,\beta+2,\mu} f(z), \Gamma_{\pi,\rho,\beta+3,\mu} f(z), \Gamma_{\pi,\rho,\beta+4,\mu} f(z) \right) : z \in U^{\circ} \right\}$$

is univalent in U°, and the two conditions (7) and (22) are satisfied as

$$\mathscr{k}_1(z) \prec \{Y\big(\Gamma_{\pi,\rho,\beta,\mu}f(z),\Gamma_{\pi,\rho,\beta+1,\mu}f(z),\Gamma_{\pi,\rho,\beta+2,\mu}f(z),\Gamma_{\pi,\rho,\beta+3,\mu}f(z),\Gamma_{\pi,\rho,\beta+4,\mu}f(z); z \in U^\circ)\} \prec \mathscr{k}_2(z),$$

then

$$\mathbb{q}_1(z) \prec \Gamma_{\pi,\rho,\beta,\mu}f(z) \prec \mathbb{q}_2(z)$$

6. Conclusions

A new differential operator is introduced in the present paper in Definition 1. Using the concepts of fourth-order differential subordination and superordination, the classes of admissible functions are defined related to each of the two concepts, and using those definitions, several theorems are proved involving the newly defined operator regarding fourth-order subordinations in Section 3 and regarding fourth-order superordination in Section 4. By applying a well-known technique, a sandwich-type theorem is stated in Section 5 of the paper combining the subordination and superordination results obtained before. The results presented here could inspire future work involving other operators for obtaining fourth-order differential subordinations and superordinations. Certain special classes of univalent functions could be introduced using the operator defined in this paper, and studies for obtaining properties of those classes could be done invoking the notions of fourth-order differential subordination and superordination using the admissibility conditions given here in Definition 7., Definition 8. and Definition 9. and the best dominant obtained in Theorem 5.
