Abstract: This paper is devoted to the approximation of a certain class of analytic functions by shifts $\mathcal{Z}(s + i\tau)$, $\tau \in \mathbb{R}$, of the modified Mellin transform $\mathcal{Z}(s)$ of the square of the Riemann zeta-function $\zeta(1/2 + it)$. More precisely, we prove the existence of a closed non-empty set F such that there are infinitely many shifts $\mathcal{Z}(s + i\tau)$, which approximate a given analytic function from F with a given accuracy. In the proof, the weak convergence of measures in the space of analytic functions is applied. Then, the set F coincides with the support of a limit measure.

Keywords: limit theorem; Mellin transform; Riemann zeta-function; weak convergence

MSC: 11M06

1. Introduction

Recall that the Riemann zeta-function $\zeta(s)$, $s = \sigma + it$, is defined, for $\sigma > 1$, by the Dirichlet series

$$\zeta(s) = \sum_{m=1}^{\infty} \frac{1}{m^s},$$

and is analytically continuable to the whole complex plane, except for the point $s = 1$, which is a simple pole with residue 1. It is well known that the function $\zeta(s)$ has good approximation properties, its shifts $\zeta(s + i\tau)$, $\tau \in \mathbb{R}$, approximate every non-vanishing analytic function defined on the strip $\{s \in \mathbb{C} : 1/2 < \sigma < 1\}$. On the other hand, in the theory of the function $\zeta(s)$, there exists several important unsolved problems. One of them is the moment problem on the asymptotic behavior as $T \rightarrow \infty$ for

$$\int_0^T |\zeta(\sigma + it)|^{2k} dt, \quad \sigma \geq \frac{1}{2}, k > 0.$$

Y. Motohashi introduced [1], see also [2], the modified Mellin transforms

$$\mathcal{Z}_k(s) = \int_1^{\infty} \left| \zeta\left(\frac{1}{2} + ix\right) \right|^{2k} x^{-s} dx, \quad k \in \mathbb{N},$$

and applied them for investigation of the latter problem. He first considered the case $k = 2$. The integral for $\mathcal{Z}_k(s)$ [3] is absolutely convergent for $\sigma > 1$ if $0 \leq k \leq 2$, and for $\sigma > (k + 2)/4$ if $2 \leq k \leq 6$. Hence, the function $\mathcal{Z}_k(s)$ is analytic in the corresponding half-planes. Later, the Mellin transforms $\mathcal{Z}_k(s)$ with applications were studied in [4–6].

We give one example from [4]. Define $E_2(T)$ by

$$\int_0^T \left| \zeta \left(\frac{1}{2} + it \right) \right|^4 dt = TP_4(\log T) + E_2(T)$$

with

$$P_4(x) = \sum_{j=0}^4 a_j x^j, \quad a_4 = \frac{1}{2\pi^2}.$$

There exists a problem to estimate $E_2(T)$. In [4], using the mean square estimates for $Z(s)$, it was obtained that, for $\varepsilon > 0$,

$$E_2(T) \ll_{\varepsilon} T^{2/3+\varepsilon},$$

and this estimate is the best up to ε . The notation $a \ll_{\varepsilon} b$, $a \in \mathbb{C}$, $b > 0$, means that there exists a positive constant $c = c(\varepsilon)$ such that $|a| \leq cb$.

In function theory, much attention is devoted to the approximation of analytic functions. We recall some results related to number theory. S.N. Mergelyan obtained [7] a very deep result connected to polynomials. Suppose that K is a compact set with a connected complement, and $f(s)$ a continuous function on K , which is analytic inside of K . Mergelyan proved [7] the existence of a polynomial sequence uniformly convergent on K to the function $f(s)$. From this, it follows that, for any $\varepsilon > 0$, we can find a polynomial $p_{f,\varepsilon}(s)$ satisfying

$$\sup_{s \in K} |f(s) - p_{f,\varepsilon}(s)| < \varepsilon.$$

Thus, a function satisfying the above hypotheses can be approximated by a polynomial.

In 1975, it turned out that there exist functions that approximate a whole class of analytic functions. The first example of such functions is the Riemann zeta-function. S.M. Voronin proved [8] that if $0 < r < 1/4$, the function $f(s) \neq 0$ is continuous on the disc $|s| \leq r$, and analytic inside that disc, then, for any $\varepsilon > 0$, there is a real number $\tau = \tau(\varepsilon)$ satisfying the inequality

$$\max_{|s| \leq r} \left| f(s) - \zeta \left(s + \frac{3}{4} + i\tau \right) \right| < \varepsilon.$$

This shows that a set of non-vanishing analytic functions defined in the strip $\{s \in \mathbb{C} : 1/2 < \sigma < 1\}$ is approximated by shifts $\zeta(s + i\tau)$ of one and the same function. In other words, $\zeta(s)$ is universal with respect to the approximation of analytic functions. The Voronin universality theorem was reinforced and extended for other zeta-functions. We recall its last form, see [9–12]. Suppose that $K \subset D$ is a compact set having a connected complement, $f(s)$ is continuous, having no zeros on K and analytic in inside of K function. Then, for any positive ε ,

$$\liminf_{T \rightarrow \infty} \frac{1}{T} \mu \left\{ \tau \in [0, T] : \sup_{s \in K} |\zeta(s + i\tau) - f(s)| < \varepsilon \right\} > 0.$$

Here, μ stands for the Lebesgue measure on the line $\mathbb{R}$.

The proof of the Voronin theorem in [8] is based on the rearrangement theorem for series in Hilbert space. B. Bagchi proposed [12] a new original probabilistic method that uses weak convergence of measures in the space of analytic functions. The Bagchi method was developed in [9,10]. Other results on the universality of zeta-functions are discussed in a survey paper [13]. We notice that an idea of application probabilistic methods in the theory of $\zeta(s)$ was proposed by H. Bohr and B. Jessen. In [14,15], they obtained the existence of the limit

$$\lim_{T \rightarrow \infty} \frac{1}{T} J \{ t \in [0, T] : \zeta(\sigma + it) \in R \}$$

for every rectangle $R \subset \mathbb{C}$ with edges parallel to the axis and $\sigma > 1/2$. Here, J denotes the Jordan measure on $\mathbb{R}$. A modern version of the Bohr–Jessen theorem in terms of weak convergence is presented in [9].

In general, for description value distribution of $\zeta(s)$, various methods and terms are used. For example, it was observed in [16] that the distribution of a -points of $\zeta(s)$, $a \neq 0$ (the solution of $\zeta(s) = a$), has a certain relation to a Julia line [17] with respect to the essential singularity of $\zeta(s)$ at infinity.

In the present paper, we are connected to a new problem—the approximation of analytic functions by the function $\mathcal{Z}(s) \stackrel{\text{def}}{=} \mathcal{Z}_1(s)$. We need some results from [3]. The function $\mathcal{Z}(s)$ is analytic in the half-plane $\sigma > -3/4$, except for a double pole at the point $s = 1$, and has simple poles at the points $s = -(2k - 1)$, $k \in \mathbb{N}$. Let γ_0 be the Euler constant, $E(T)$ be defined by

$$\int_0^T \left| \zeta\left(\frac{1}{2} + it\right) \right|^2 dt = T \log \frac{T}{2\pi} + (2\gamma_0 - 1)T + E(T),$$

and

$$G(T) = \int_1^T E(t) dt - \pi T, \quad G_1(T) = \int_1^T G(t) dt.$$

Then, it was obtained that

$$\begin{aligned} \mathcal{Z}(s) = & \frac{1}{(s-1)^2} + \frac{2\gamma_0 - \log 2\pi}{s-1} - E(1) + \pi(s+1) \\ & + s(s+1)(s+2) \int_1^\infty G_1(x) x^{-s-3} dx, \quad \sigma > -\frac{3}{4}. \end{aligned} \quad (1)$$

Moreover, for $0 \leq \sigma \leq 1$, $t \geq t_0 > 0$, and fixed $\varepsilon > 0$,

$$\mathcal{Z}(\sigma + it) \ll_\varepsilon t^{1-\sigma+\varepsilon},$$

and

$$\int_1^T |\mathcal{Z}(\sigma + it)|^2 dt \ll_\varepsilon \begin{cases} T^{3-4\sigma+\varepsilon} & \text{if } 0 \leq \sigma \leq \frac{1}{2}, \\ T^{2-2\sigma+\varepsilon} & \text{if } \frac{1}{2} \leq \sigma \leq 1. \end{cases} \quad (2)$$

Let $D = \{s \in \mathbb{C} : 1/2 < \sigma < 1\}$, and $H(D)$ be the space of analytic on D functions equipped with the topology of uniform convergence on compacts. The main result of the paper is the following theorem.

Theorem 1. *There is a non-empty closed subset $F \subset H(D)$ such that, for arbitrary compact set $K \subset D$, $f(s) \in F$, and every $\varepsilon > 0$,*

$$\liminf_{T \rightarrow \infty} \frac{1}{T} \mu \left\{ \tau \in [0, T] : \sup_{s \in K} |\mathcal{Z}(s + i\tau) - f(s)| < \varepsilon \right\} > 0.$$

Moreover, except for at most a countably set of values of $\varepsilon > 0$, “lim inf” can be replaced by “lim”.

Theorem 1 implies that there are infinitely many shifts $\mathcal{Z}(s + i\tau)$ approximating a function from the set F . Theorem 1 is a certain version of the modern form of the Voronin universality theorem [8] for the Riemann zeta-function, see, for example, [9,10]. In the case of $\zeta(s)$, $F = \{g \in H(D) : g(s) \neq 0 \text{ or } g(s) \equiv 0\}$.

Unfortunately, in the case of Theorem 1, the set F cannot be explicit described. Let $\mathcal{B}(\mathcal{X})$ stand for Borel σ -field of the space $\mathcal{X}$. We will show that F is the support of a

probability measure on $(H(D), \mathcal{B}(H(D)))$. Theorem 1 is a corollary of a limit theorem for weakly convergent measures in the space $(H(D), \mathcal{B}(H(D)))$. For $A \in \mathcal{B}(H(D))$, set

$$P_T(A) = \frac{1}{T} \mu\{\tau \in [0, T] : \mathcal{Z}(s + i\tau) \in A\}.$$

Denote by $\xrightarrow{W}$ the weak convergence.

Theorem 2. *On the space $(H(D), \mathcal{B}(H(D)))$, there is a probability measure P such that $P_T \xrightarrow{T \rightarrow \infty} P$.*

For the proof of Theorem 2, the auxiliary function

$$\mathcal{Z}_y(s) = \int_1^\infty \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 v(x, y) x^{-s} dx,$$

where

$$v(x, y) = \exp\left\{-\left(\frac{x}{y}\right)^{\sigma_0}\right\}, \quad x, y \in (1, \infty),$$

with a fixed $\sigma_0 > 0$, will be useful.

2. Case of Finite Interval

Let $a > 1$, and

$$\mathcal{Z}_{a,y}(s) = \int_1^a \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 v(x, y) x^{-s} dx,$$

For $A \in \mathcal{B}(H(D))$, set

$$P_{T,a,y}(A) = \frac{1}{T} \mu\{\tau \in [0, T] : \mathcal{Z}_{a,y}(s + i\tau) \in A\}.$$

Lemma 1. *On the space $(H(D), \mathcal{B}(H(D)))$, there is a probability measure $P_{a,y}$ such that $P_{T,a,y} \xrightarrow{T \rightarrow \infty} P_{a,y}$.*

The proof of Lemma 1 is divided into parts. In the first part, we will deal with weak convergence on a certain Cartesian product. Let γ be the unit circle on $\mathbb{C}$, and

$$\Omega_a = \prod_{u \in [1, a]} \gamma.$$

In virtue of the Tikhonov theorem, the set Ω_a with the product topology is a compact topological Abelian group. For $A \in \mathcal{B}(\Omega_a)$, set

$$Q_{T,a}(A) = \frac{1}{T} \mu\left\{\tau \in [0, T] : \left(u^{-i\tau} : u \in [1, a]\right) \in A\right\}.$$

Lemma 2. *On the space $(\Omega_a, \mathcal{B}(\Omega_a))$, there is a probability measure Q_a such that $Q_{T,a} \xrightarrow{T \rightarrow \infty} Q_a$.*

Proof. The character group of Ω_a is isomorphic to $\bigoplus_{u \in [1, a]} \mathbb{Z}_u$, where $\mathbb{Z}_u = \mathbb{Z}$ for all $u \in [1, a]$. Therefore, the Fourier transform $g_{T,a}(k_u : u \in [1, a])$ of $Q_{T,a}$ is given by

$$g_{T,a}(k_u : u \in [1, a]) = \int_{\Omega_a} \prod_{u \in [1, a]} x_u^{k_u} dQ_{T,a},$$

where $x_u \in \gamma$, $k_u \in \mathbb{Z}$, and only a finite number of k_u are not zeros. Thus,

$$g_{T,a}(k_u : u \in [1, a]) = \frac{1}{T} \int_0^T \exp \left\{ -i\tau \sum_{u \in [1, a]} k_u \log u \right\} d\tau$$

$$= \begin{cases} 1 & \text{if } \sum_{u \in [1, a]} k_u \log u = 0, \\ \frac{1 - \exp \left\{ -i\tau \sum_{u \in [1, a]} k_u \log u \right\}}{iT \sum_{u \in [1, a]} k_u \log u} & \text{if } \sum_{u \in [1, a]} k_u \log u \neq 0. \end{cases}$$

Therefore, we have

$$\lim_{T \rightarrow \infty} g_{T,a}(k_u : u \in [1, a]) \stackrel{\text{def}}{=} g_a(k_u : u \in [1, a]) = \begin{cases} 1 & \text{if } \sum_{u \in [1, a]} k_u \log u = 0, \\ 0 & \text{if } \sum_{u \in [1, a]} k_u \log u \neq 0. \end{cases}$$

This shows that $Q_{T,a} \xrightarrow{T \rightarrow \infty} Q_a$ with Q_a on $(\Omega_a, \mathcal{B}(\Omega_a))$ with the Fourier transform $g_a(k_u : u \in [1, a])$. $\square$

Lemma 2 implies a certain limit lemma in the space $H(D)$. We recall that if $h : \mathcal{X} \rightarrow \mathcal{X}_1$ is a $(\mathcal{B}(\mathcal{X}), \mathcal{B}(\mathcal{X}_1))$ -measurable mapping, then a probability measure P on $(\mathcal{X}, \mathcal{B}(\mathcal{X}))$ defines the unique probability measure Ph^{-1} on $(\mathcal{X}_1, \mathcal{B}(\mathcal{X}_1))$ defined by $Ph^{-1}(A) = P(h^{-1}A)$, $A \in \mathcal{X}_1$. Moreover, if the mapping h is continuous, then the weak convergence is preserved, i.e., if $P_n \xrightarrow{n \rightarrow \infty} P$ in $\mathcal{X}$, then also $P_n h^{-1} \xrightarrow{n \rightarrow \infty} Ph^{-1}$ in $\mathcal{X}_1$. The latter remark is sometimes very useful.

Let

$$S_{n,a,y}(s) = \frac{a-1}{n} \sum_{k=1}^n \left| \zeta \left(\frac{1}{2} + i\zeta_k \right) \right|^2 v(\zeta_k, y) \zeta_k^{-s},$$

where $\zeta_k \in [x_{k-1}, x_k]$ and $x_k = 1 + ((a-1)/n)k$. For $A \in \mathcal{B}(H(D))$, let

$$P_{T,n,a,y}(A) = \frac{1}{T} \mu \{ \tau \in [0, T] : S_{n,a,y}(s + i\tau) \in A \}.$$

Lemma 3. On the space $(H(D), \mathcal{B}(H(D)))$, there is a probability measure $P_{n,a,y}$ such that $P_{T,n,a,y} \xrightarrow{T \rightarrow \infty} P_{n,a,y}$.

Proof. Let the mapping $h_{n,a} : \Omega_a \rightarrow H(D)$ be given by the formula

$$h_{n,a}(\underline{y}) = \frac{a-1}{n} \sum_{k=1}^n \left| \zeta \left(\frac{1}{2} + i\zeta_k \right) \right|^2 v(\zeta_k, y) \zeta_k^{-s} y_{\zeta_k}, \quad \underline{y} = \{y_u \in \gamma : u \in [1, a]\}.$$

Then, $h_{n,a}$ is a continuous in the product topology, and $h_{n,a}(\{u^{-i\tau} : u \in [1, a]\}) = S_{n,a,y}(s + i\tau)$. Thus, $P_{T,n,a,y} = Q_{T,a} h_{n,a}^{-1}$, where $Q_{T,a}$ comes from Lemma 2. This equality, the continuity of $h_{n,a}$, Lemma 2 and the above remark on the preservation of weak convergence show that $P_{T,n,a,y}$ converges weakly to $P_{n,a,y} = Q_a h_{n,a}^{-1}$ as $T \rightarrow \infty$ with Q_a defined in Lemma 2. $\square$

In the sequel, we will use one lemma on the convergence in distribution $(\xrightarrow{\mathcal{D}})$. Recall that the random element X_n converges in distribution to X as $n \rightarrow \infty$, if the distribution P_n of X_n converges weakly to that P of X as $n \rightarrow \infty$. In this case, we use the notation $X_n \xrightarrow{n \rightarrow \infty} P$ as well.

Suppose that the metric space $(\mathcal{X}, d)$ is separable and the $\mathcal{X}$ -valued random elements X, Y_n and X_{nk} are defined on the same probability space with measure $\mathbb{P}$.

Lemma 4. For $k \in \mathbb{N}$, let

$$X_{nk} \xrightarrow[n \rightarrow \infty]{\mathcal{D}} X_k$$

and

$$X_k \xrightarrow[k \rightarrow \infty]{\mathcal{D}} X.$$

If, for any $\varepsilon > 0$,

$$\lim_{k \rightarrow \infty} \limsup_{n \rightarrow \infty} \mathbb{P}\{d(X_{nk}, Y_n) \geq \varepsilon\} = 0,$$

then $Y_n \xrightarrow[n \rightarrow \infty]{\mathcal{D}} X$.

The lemma is proved, for example, in [18], Theorem 4.2.

We note that the space $H(D)$ is separable and metrizable. It is known that there is a sequence $\{K_l : l \in \mathbb{N}\} \subset D$ of compact embedded sets such that D is the union of K_l , and every set $K \subset D$ lies in some set K_l . Then,

$$\rho(g_1, g_2) = \sum_{l=1}^{\infty} 2^{-l} \frac{\sup_{s \in K_l} |g_1(s) - g_2(s)|}{1 + \sup_{s \in K_l} |g_1(s) - g_2(s)|}, \quad g_1, g_2 \in H(D),$$

is a metric in $H(D)$ which induces its topology of uniform convergence on compacts.

Lemma 5. The equality

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \rho(S_{n,a,y}(s + i\tau), Z_{a,y}(s + i\tau)) d\tau = 0$$

holds.

Proof. The definition of the metric ρ implies that it suffices to show that

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |S_{n,a,y}(s + i\tau) - Z_{a,y}(s + i\tau)| d\tau = 0 \quad (3)$$

for every compact set $K \subset D$. Let L be a simple closed contour lying in D and enclosing a compact set K ; suppose also that $\inf_{s \in K} \inf_{z \in L} |s - z| \geq c(L) > 0$. Then, by the integral Cauchy formula, we have

$$\sup_{s \in K} |S_{n,a,y}(s + i\tau) - Z_{a,y}(s + i\tau)| \ll_L \int_L |S_{n,a,y}(z + i\tau) - Z_{a,y}(z + i\tau)| |dz|.$$

Therefore,

$$\begin{aligned} & \frac{1}{T} \int_0^T \sup_{s \in K} |S_{n,a,y}(s + i\tau) - Z_{a,y}(s + i\tau)| d\tau \\ & \ll_L \int_L |dz| \left(\frac{1}{T} \int_0^T |S_{n,a,y}(z + i\tau) - Z_{a,y}(z + i\tau)| d\tau \right). \end{aligned} \quad (4)$$

Clearly,

$$\begin{aligned} & \frac{1}{T} \int_0^T |S_{n,a,y}(z+i\tau) - \mathcal{Z}_{a,y}(z+i\tau)| d\tau \\ & \leq \left(\frac{1}{T} \int_0^T |S_{n,a,y}(z+i\tau) - \mathcal{Z}_{a,y}(z+i\tau)|^2 d\tau \right)^{1/2} \end{aligned} \quad (5)$$

We have

$$\begin{aligned} & |S_{n,a,y}(z+i\tau) - \mathcal{Z}_{a,y}(z+i\tau)|^2 \\ & = (S_{n,a,y}(z+i\tau) - \mathcal{Z}_{a,y}(z+i\tau)) \overline{(S_{n,a,y}(z+i\tau) - \mathcal{Z}_{a,y}(z+i\tau))} \\ & = S_{n,a,y}(z+i\tau) \overline{S_{n,a,y}(z+i\tau)} - S_{n,a,y}(z+i\tau) \overline{\mathcal{Z}_{a,y}(z+i\tau)} \\ & \quad - \overline{S_{n,a,y}(z+i\tau)} \mathcal{Z}_{a,y}(z+i\tau) + \overline{\mathcal{Z}_{a,y}(z+i\tau)} \mathcal{Z}_{a,y}(z+i\tau), \end{aligned} \quad (6)$$

where $\bar{z}$ denotes the complex conjugate of $z \in \mathbb{C}$. By the definition of $S_{n,a,y}(s)$,

$$\begin{aligned} S_{n,a,y}(z+i\tau) \overline{S_{n,a,y}(z+i\tau)} & = \left(\frac{a-1}{n} \right)^2 \sum_{k=1}^n \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_k \right) \right|^4 v^2(\tilde{\zeta}_k, y) \tilde{\zeta}_k^{-2\operatorname{Re} z} \\ & \quad + \left(\frac{a-1}{n} \right)^2 \sum_{\substack{k_1=1 \\ k_1 \neq k_2}}^n \sum_{k_2=1}^n \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_{k_1} \right) \right|^2 \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_{k_2} \right) \right|^2 \\ & \quad \times v(\tilde{\zeta}_{k_1}, y) v(\tilde{\zeta}_{k_2}, y) \tilde{\zeta}_{k_1}^{-z} \tilde{\zeta}_{k_2}^{-\bar{z}} \left(\frac{\tilde{\zeta}_{k_1}}{\tilde{\zeta}_{k_2}} \right)^{-i\tau}. \end{aligned}$$

Therefore,

$$\begin{aligned} & \frac{1}{T} \int_0^T S_{n,a,y}(z+i\tau) \overline{S_{n,a,y}(z+i\tau)} d\tau \\ & = \left(\frac{a-1}{n} \right)^2 \sum_{k=1}^n \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_k \right) \right|^4 v^2(\tilde{\zeta}_k, y) \tilde{\zeta}_k^{-2\operatorname{Re} z} \\ & \quad + O \left(\left(\frac{a-1}{n} \right)^2 \frac{1}{T} \sum_{\substack{k_1=1 \\ k_1 \neq k_2}}^n \sum_{k_2=1}^n \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_{k_1} \right) \right|^2 \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_{k_2} \right) \right|^2 \right. \\ & \quad \left. \times v(\tilde{\zeta}_{k_1}, y) v(\tilde{\zeta}_{k_2}, y) \tilde{\zeta}_{k_1}^{-\operatorname{Re} z} \tilde{\zeta}_{k_2}^{\operatorname{Re} z} \left| \log \frac{\tilde{\zeta}_{k_1}}{\tilde{\zeta}_{k_2}} \right|^{-1} \right). \end{aligned}$$

Since

$$\lim_{n \rightarrow \infty} \frac{a-1}{n} \sum_{k=1}^n \left| \zeta \left(\frac{1}{2} + i\tilde{\zeta}_k \right) \right|^4 v^2(\tilde{\zeta}_k, y) \tilde{\zeta}_k^{-2\operatorname{Re} z} = \int_1^a \left| \zeta \left(\frac{1}{2} + ix \right) \right|^4 v^2(x, y) x^{-2\operatorname{Re} z} dx,$$

hence we obtain, for all $z \in L$,

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T S_{n,a,y}(z+i\tau) \overline{S_{n,a,y}(z+i\tau)} d\tau = 0. \quad (7)$$

Similarly, by the definition of $\mathcal{Z}_{a,y}(s)$, for all $z \in L$,

$$\begin{aligned}
& \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \mathcal{Z}_{a,y}(z + i\tau) \overline{\mathcal{Z}_{a,y}(z + i\tau)} d\tau \\
&= \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \left(\int_1^a \int_1^a \left| \zeta\left(\frac{1}{2} + ix_1\right) \right|^2 \left| \zeta\left(\frac{1}{2} + ix_2\right) \right|^2 \right. \\
&\quad \times v(x_1, y) v(x_2, y) x_1^{-z-i\tau} x_2^{-\bar{z}+i\tau} dx_1 dx_2 \Big) d\tau \\
&= \limsup_{T \rightarrow \infty} \frac{1}{T} \int_1^a \int_1^a \left| \zeta\left(\frac{1}{2} + ix_1\right) \right|^2 \left| \zeta\left(\frac{1}{2} + ix_2\right) \right|^2 \\
&\quad \times v(x_1, y) v(x_2, y) x_1^{-z} x_2^{-\bar{z}} \left(e^{-iT \log(x_1/x_2)} - 1 \right) \left(\log \frac{x_1}{x_2} \right)^{-1} dx_1 dx_2 = 0. \quad (8)
\end{aligned}$$

The latter equality suggests that the set of values of the function $\mathcal{Z}_{a,y}(s)$ is not dense. On the other hand, this case is convenient for our investigations. Moreover,

$$\begin{aligned}
& \left| \frac{1}{T} \int_0^T S_{n,a,y}(z + i\tau) \overline{\mathcal{Z}_{a,y}(z + i\tau)} d\tau \right| \\
&\leq \left(\frac{1}{T} \int_0^T |S_{n,a,y}(z + i\tau)|^2 d\tau \right)^{1/2} \left(\frac{1}{T} \int_0^T |\mathcal{Z}_{a,y}(z + i\tau)|^2 d\tau \right)^{1/2},
\end{aligned}$$

and this is true for the integral of $\overline{S_{n,a,y}(z + i\tau)} \mathcal{Z}_{a,y}(z + i\tau)$. This and (4)–(8) show that

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |S_{n,a,y}(s + i\tau) - \mathcal{Z}_{a,y}(s + i\tau)| d\tau = 0.$$

□

Proof of Lemma 1. Suppose that θ_T is a random variable uniformly distributed on $[0, T]$ and defined on a certain probability space with measure $\mathbb{P}$. Define the $H(D)$ -valued random element

$$X_{T,n,a,y}(s) = S_{n,a,y}(s + i\theta_T).$$

In view of Lemma 3, we have

$$X_{T,n,a,y} \xrightarrow[T \rightarrow \infty]{\mathcal{D}} X_{n,a,y}, \quad (9)$$

where $X_{n,a,y}$ is the $H(D)$ -valued random element with the distribution $P_{n,a,y}$.

Now, we will prove that the sequence $\{P_{n,a,y} : n \in \mathbb{N}\}$ is tight, i.e., that, for every $\varepsilon > 0$, there exists a compact set $K = K(\varepsilon) \subset H(D)$ such that

$$P_{n,a,y}(K) > 1 - \varepsilon$$

for all $n \in \mathbb{N}$. Let K_l be a compact set in the definition of the metric ρ . Then, (7) and the integral Cauchy formula imply

$$\sup_{n \in \mathbb{N}} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K_l} |S_{n,a,y}(s + i\tau)| d\tau \leq R_{l,a,y} < \infty.$$

Let $\varepsilon > 0$ be a fixed, and $M_l = M_{l,a,y} = R_{l,a,y} 2^l \varepsilon^{-1}$. Then, in view of (9),

$$\mathbb{P}\left(\sup_{s \in K_l} |X_{n,a,y}(s)| > M_l\right) \leq \sup_{n \in \mathbb{N}} \limsup_{T \rightarrow \infty} \frac{1}{M_l T} \int_0^T \sup_{s \in K_l} |S_{n,a,y}(s + i\tau)| d\tau \leq \frac{\varepsilon}{2^l} \quad (10)$$

for all n and $l \in \mathbb{N}$. Let

$$K = K(\varepsilon) = \left\{g \in H(D) : \sup_{s \in K_l} |g(s)| \leq M_l, l \in \mathbb{N}\right\}.$$

Then, the set K is compact in the space $H(D)$, and, by (10),

$$\mathbb{P}(X_{n,a,y} \in K) = 1 - \mathbb{P}(X_{n,a,y} \notin K) > 1 - \varepsilon \sum_{l=1}^{\infty} 2^{-l} = 1 - \varepsilon$$

for all $n \in \mathbb{N}$. This and the definition of $P_{n,a,y}$ prove the tightness of the sequence $\{P_{n,a,y} : n \in \mathbb{N}\}$. In the theory of weak convergence of probability measures, the Prokhorov theorem, see, for example, [18], occupies an important place. Let $\{P\}$ be a family of probability measures on $(\mathcal{X}, \mathcal{B}(\mathcal{X}))$. The Prokhorov theorem connects the tightness and relative compactness of $\{P\}$; namely, if the family $\{P\}$ is tight, then it is relatively compact.

Since the sequence $\{P_{n,a,y}\}$ is tight, by the Prokhorov theorem [18], it is relatively compact, i.e., every subsequence $\{P_{n_k,a,y}\}$ contains a subsequence weakly convergent to a certain probability measure on $(H(D), \mathcal{B}(H(D)))$. Thus, there exists a probability measure $P_{a,y}$ on $(H(D), \mathcal{B}(H(D)))$ and a sequence $\{P_{n_r,a,y}\}$ such that $P_{n_r,a,y}$ converges weakly to $P_{a,y}$ as $r \rightarrow \infty$. In other words,

$$X_{n_r,a,y} \xrightarrow[r \rightarrow \infty]{\mathcal{D}} P_{a,y}. \quad (11)$$

Now, we are in position to apply Lemma 4 for the random elements

$$Y_{T,a,y}(s) = \mathcal{Z}_{a,y}(s + i\theta_T),$$

$X_{n_r,a,y}$ and $X_{a,y}$, where $X_{a,y}$ has the distribution $P_{a,y}$. By Lemma 5, we have, for every $\varepsilon > 0$,

$$\begin{aligned} & \lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \mathbb{P}(\rho(Y_{T,a,y}, X_{n_r,a,y}) \geq \varepsilon) \\ & \leq \lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T\varepsilon} \int_0^T \rho(S_{n_r,a,y}(s + i\tau), \mathcal{Z}_{a,y}(s + i\tau)) d\tau = 0. \end{aligned}$$

This, (9) and (11) together with Lemma 5 prove Lemma 1, i.e., $P_{T,a,y}$ converges weakly to $P_{a,y}$ as $T \rightarrow \infty$. $\square$

3. Case of Infinite Interval

In this section, we will prove a limit theorem for the function $\mathcal{Z}_y(s)$. Since $\zeta(1/2 + it) \ll t^{1/6}$ as $t \rightarrow \infty$, and $v(x, y)$ with respect to x is decreasing exponentially, the integral for $\mathcal{Z}_y(s)$ is absolutely convergent for $\sigma > \sigma_0$ with every fixed σ_0 and $y > 0$.

For $A \in \mathcal{B}(H(D))$, define

$$P_{T,y}(A) = \frac{1}{T} \mu\{\tau \in [0, T] : \mathcal{Z}_y(s + i\tau) \in A\}.$$

Lemma 6. On $(H(D), \mathcal{B}(H(D)))$, there exists a probability measure P_y such that $P_{T,y} \xrightarrow[T \rightarrow \infty]{W} P_y$.

Proof. First, we observe that the equality

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \rho(\mathcal{Z}_y(s + i\tau), \mathcal{Z}_{a,y}(s + i\tau)) d\tau = 0 \quad (12)$$

holds. As in the case of Lemma 5, it suffices to show that, for every compact set $K \subset D$,

$$\lim_{n \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s + i\tau) - \mathcal{Z}_{a,y}(s + i\tau)| d\tau = 0. \quad (13)$$

It is easily seen that, for every fixed $y > 0$ and $s \in K$,

$$\begin{aligned} \mathcal{Z}_y(s + i\tau) - \mathcal{Z}_{a,y}(s + i\tau) &= \int_a^\infty \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 v(x, y) x^{-s-i\tau} dx \\ &\ll_y \int_a^\infty \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 v(x, y) x^{-1/2} dx = o_y(1) \end{aligned}$$

as $a \rightarrow \infty$ in view of convergence of the integral. From this, equality (13) follows.

Let θ_T be the same random variable as in the proof of Lemma 1. Define

$$Y_{T,y}(s) = \mathcal{Z}_y(s + i\theta_T),$$

and denote by $Y_{a,y}$ the $H(D)$ -valued random element with the distribution $P_{a,y}$. Then, Lemma 1 implies the relation

$$Y_{T,a,y} \xrightarrow[T \rightarrow \infty]{\mathcal{D}} Y_{a,y}. \quad (14)$$

Let $K_l, l \in \mathbb{N}$ be a compact set from the definition of metric ρ . Then, (8) and the integral Cauchy formula give

$$\sup_{a \geq 1} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K_l} |\mathcal{Z}_{a,y}(s + i\tau)| d\tau \leq R_{l,y} < \infty.$$

Thus, taking $\widehat{M}_l = \widehat{M}_{l,y} = R_{l,y} 2^l \varepsilon^{-1}$, we find by (14)

$$\mathbb{P}\left(\sup_{s \in K_l} |Y_{a,y}(s)| > \widehat{M}_l\right) \leq \sup_{a \geq 1} \limsup_{T \rightarrow \infty} \frac{1}{\widehat{M}_l T} \int_0^T \sup_{s \in K_l} |\mathcal{Z}_{a,y}(s + i\tau)| d\tau \leq \frac{\varepsilon}{2^l}.$$

This shows that

$$\mathbb{P}(Y_{a,y} \in K) > 1 - \varepsilon,$$

for all $a \geq 1$, where $K = \{g \in H(D) : \sup_{s \in K_l} |g(s)| \leq \widehat{M}_l, l \in \mathbb{N}\}$. Therefore, the family of probability measures $\{P_{a,y} : a \geq 1\}$ is tight. Thus, there exists a sequence $P_{a_r,y}$ weakly convergent to a certain probability measure P_y as $r \rightarrow \infty$, i.e.,

$$Y_{a_r,y} \xrightarrow[r \rightarrow \infty]{\mathcal{D}} P_y.$$

This, (12), (14) and Lemma 4 prove that

$$Y_{T,y} \xrightarrow[T \rightarrow \infty]{\mathcal{D}} P_y, \quad (15)$$

and the lemma is proved. $\square$

4. Formula for $\mathcal{Z}_y(s)$

As usual, denote by $\Gamma(s)$ the Euler gamma-function, and define

$$l_y(s) = \frac{s}{\sigma_0} \Gamma\left(\frac{s}{\sigma_0}\right) y^s,$$

where σ_0 is from definition of $v(x, y)$.

Lemma 7. *The integral representation, for $s \in D$,*

$$\mathcal{Z}_y(s) = \frac{1}{2\pi i} \int_{\sigma_0 - i\infty}^{\sigma_0 + i\infty} \mathcal{Z}(s+z) l_y(z) \frac{dz}{z}$$

is valid.

Proof. We will apply the classical Mellin formula

$$\frac{1}{2\pi i} \int_{a-i\infty}^{a+i\infty} \Gamma(s) b^{-s} ds = e^{-b}, \quad a, b > 0,$$

and obtain

$$\begin{aligned} \frac{1}{2\pi i} \int_{\sigma_0 - i\infty}^{\sigma_0 + i\infty} l_y(z) x^{-z} \frac{dz}{z} &= \frac{1}{2\pi i} \int_{\sigma_0 - i\infty}^{\sigma_0 + i\infty} \frac{1}{\sigma_0} \Gamma\left(\frac{z}{\sigma_0}\right) \left(\frac{x}{y}\right)^{-z} dz \\ &= \frac{1}{2\pi i} \int_{1-i\infty}^{1+i\infty} \Gamma(z) \left(\frac{x}{y}\right)^{-\sigma_0 z} dz \\ &= \exp\left\{-\left(\frac{x}{y}\right)^{\sigma_0}\right\} = v(x, y). \end{aligned} \quad (16)$$

Setting, for brevity,

$$f(x, t) = \frac{1}{2\pi i} \frac{l_y(\sigma_0 + it)}{\sigma_0 + it} \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 x^{-s - \sigma_0 - it}$$

and applying theorem from ([19], §1.84), we obtain

$$\int_{-T}^T dt \int_1^X f(x, t) dx = \int_1^X dx \int_{-T}^T f(x, t) dt, \quad (17)$$

for any $X, T > 1$. Next, the well-known estimate

$$\Gamma(\sigma + it) \ll \exp(-c|t|), \quad c > 0,$$

which is uniform in any fixed strip $\sigma_1 < \sigma < \sigma_2$, together with the inequality

$$\int_1^X \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 dx \ll X(\log X)$$

imply

$$\int_T^{+\infty} dt \int_1^X (|f(x, t)| + |f(x, -t)|) dx, \quad \int_1^X dx \int_T^{+\infty} (|f(x, t)| + |f(x, -t)|) dt \ll R,$$

where

$$\begin{aligned} R = R(X, T) &= y^{\sigma_0} \int_T^{+\infty} e^{-ct/\sigma_0} dt \int_1^X \left| \zeta \left(\frac{1}{2} + ix \right) \right|^2 x^{-\sigma-\sigma_0} dx \\ &\ll y^{\sigma_0} \exp \left\{ -\frac{c}{\sigma_0} T \right\} (1 + X^{1-\sigma-\sigma_0}) (\log X)^2. \end{aligned} \quad (18)$$

Hence, using (17) and (18), we find that

$$\begin{aligned} \int_{-\infty}^{+\infty} dt \int_1^X f(x, t) dx &= \left(\int_{-T}^T + \int_T^{+\infty} + \int_{-\infty}^{-T} \right) dt \int_1^X f(x, t) dx \\ &= \int_1^X dx \int_{-T}^T f(x, t) dt + O(R) \\ &= \int_1^X dx \left(\int_{-\infty}^{+\infty} - \int_T^{+\infty} - \int_{-\infty}^{-T} \right) f(x, t) dt + O(R) \\ &= \int_1^X dx \int_{-\infty}^{+\infty} f(x, t) dt + O(R). \end{aligned}$$

Tending $T \rightarrow \infty$, we obtain

$$\int_{-\infty}^{+\infty} dt \int_1^X f(x, t) dx = \int_1^X dx \int_{-\infty}^{+\infty} f(x, t) dt$$

for any $X > 1$. Therefore, the application of a theorem from ([19], §1.84) together with (16) yields

$$\begin{aligned} &\frac{1}{2\pi i} \int_{\sigma_0-i\infty}^{\sigma_0+i\infty} \mathcal{Z}(s+z) l_y(z) \frac{dz}{z} \\ &= \int_{-\infty}^{+\infty} \int_1^{+\infty} \frac{1}{2\pi i} \left| \zeta \left(\frac{1}{2} + ix \right) \right|^2 \frac{l_y(\sigma_0+it)}{\sigma_0+it} x^{-s-\sigma_0-it} dx \\ &= \int_{-\infty}^{+\infty} dt \int_1^{+\infty} f(x, t) dx = \int_1^{+\infty} dx \int_{-\infty}^{+\infty} f(x, t) dt \\ &= \int_1^{+\infty} \left| \zeta \left(\frac{1}{2} + ix \right) \right|^2 x^{-s} \frac{1}{2\pi i} \int_{\sigma_0-i\infty}^{\sigma_0+i\infty} l_y(z) x^{-z} \frac{dz}{z} dx \\ &= \int_1^{+\infty} \left| \zeta \left(\frac{1}{2} + ix \right) \right|^2 x^{-s} v(x, y) dx = \mathcal{Z}_y(s). \end{aligned}$$

□

5. Approximation of $\mathcal{Z}(s)$ by $\mathcal{Z}_y(s)$

Lemma 8. *The equality*

$$\lim_{y \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \rho(\mathcal{Z}(s + i\tau), \mathcal{Z}_y(s + i\tau)) d\tau = 0$$

holds.

Proof. Let K be an arbitrary fixed compact set of the strip D . Then, there exists a number $\varepsilon > 0$ such that, for all $s = \sigma + it \in K$, $1/2 + 2\varepsilon \leq \sigma \leq 1 - \varepsilon$. Denote

$$\sigma_1 = \sigma - \varepsilon - \frac{1}{2}, \quad \sigma_0 = \frac{1}{2} + \varepsilon.$$

Then, $\sigma_1 > 0$ for all $s \in K$. Since the point $z = 1 - s$ is a double pole, and $z = 0$ is a simple pole of the function

$$\mathcal{Z}(s + z) \frac{l_y(z)}{z},$$

Lemma 7 and the residue theorem imply

$$\mathcal{Z}_y(s) - \mathcal{Z}(s) = \frac{1}{2\pi i} \int_{-\sigma_1 - i\infty}^{-\sigma_1 + i\infty} \mathcal{Z}(s + z) l_y(z) \frac{dz}{z} + R_y(s), \quad (19)$$

where

$$R_y(s) = \operatorname{Res}_{z=1-s} \mathcal{Z}(s + z) \frac{l_y(z)}{z}.$$

Let $a_0 = 2\gamma_0 - \log 2\pi$. Then, in view of (1),

$$R_y(s) = \left(\frac{l_y(z)}{z} \right)' \Big|_{z=1-s} + a_0 \frac{l_y(1-s)}{1-s}. \quad (20)$$

By (19), for all $s \in K$, we have

$$\begin{aligned} \mathcal{Z}_y(s + i\tau) - \mathcal{Z}(s + i\tau) &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \mathcal{Z}\left(\sigma + it - \sigma + \frac{1}{2} + \varepsilon + i\tau + iv\right) \\ &\quad \times \frac{l_y(1/2 + \varepsilon - \sigma + iv)}{1/2 + \varepsilon - \sigma + iv} dv + R_y(s + i\tau). \end{aligned}$$

Hence, writing v in place of $t + v$, gives, for $s \in K$,

$$\begin{aligned} \mathcal{Z}_y(s + i\tau) - \mathcal{Z}(s + i\tau) &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \mathcal{Z}\left(\frac{1}{2} + \varepsilon + i\tau + iv\right) \frac{l_y(1/2 + \varepsilon - s + iv)}{1/2 + \varepsilon - s + iv} dv \\ &\quad + R_y(s + i\tau) \\ &\ll \int_{-\infty}^{\infty} \left| \mathcal{Z}\left(\frac{1}{2} + \varepsilon + i\tau + iv\right) \right| \sup_{s \in K} \left| \frac{l_y(1/2 + \varepsilon - s + iv)}{1/2 + \varepsilon - s + iv} \right| dv \\ &\quad + \sup_{s \in K} |R_y(s + i\tau)|. \end{aligned}$$

Thus,

$$\begin{aligned}
& \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s + i\tau) - \mathcal{Z}(s + i\tau)| \, d\tau \\
& \ll \int_{-\infty}^{\infty} \left(\frac{1}{T} \int_0^T \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau + iv \right) \right| \, d\tau \right) \sup_{s \in K} \left| \frac{l_y(1/2 + \varepsilon - s + iv)}{1/2 + \varepsilon - s + iv} \right| \, dv \\
& + \frac{1}{T} \int_0^T \sup_{s \in K} |R_y(s + i\tau)| \, d\tau \stackrel{\text{def}}{=} I_1 + I_2.
\end{aligned} \tag{21}$$

First we estimate I_1 . The definition of $l_y(s)$ and (17) imply that, for $s = \sigma + it \in K$,

$$\begin{aligned}
\left| \frac{l_y(1/2 + \varepsilon - s + iv)}{1/2 + \varepsilon - s + iv} \right| & \ll_{\sigma_0} y^{1/2 + \varepsilon - \sigma} \left| \Gamma \left(\frac{1}{\sigma_0} \left(\frac{1}{2} + \varepsilon - \sigma - it + iv \right) \right) \right| \\
& \ll_{\sigma_0} y^{1/2 + \varepsilon - \sigma} \exp \left\{ -\frac{c}{\sigma_0} |t - v| \right\} \\
& \ll_{\sigma_0} y^{1/2 + \varepsilon - \sigma} \exp \left\{ -\frac{c}{\sigma_0} |v - t| \right\} \\
& \ll_{\sigma_0} y^{1/2 + \varepsilon - \sigma} \exp \left\{ \frac{c}{\sigma_0} |t| \right\} \exp \left\{ -\frac{c}{\sigma_0} |v| \right\}.
\end{aligned} \tag{22}$$

Since $\sigma \geq 1/2 + 2\varepsilon$, then $1/2 + \varepsilon - \sigma \leq -\varepsilon$ for any $s \in K$. Therefore,

$$\sup_{s \in K} \left| \frac{l_y(1/2 + \varepsilon + iv - s)}{1/2 + \varepsilon + iv - s} \right| \ll_{\sigma_0, K} y^{-\varepsilon} \exp \{ -c_1 |v| \}.$$

Thus, we obtain

$$I_1 \ll_{\sigma_0, K} y^{-\varepsilon} \int_{-\infty}^{+\infty} \exp \left\{ -\frac{c}{\sigma_0} |v| \right\} \frac{1}{T} \int_0^T \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau + iv \right) \right| \, d\tau \, dv.$$

Given $0 < \varepsilon_1 < \varepsilon$, Cauchy inequality together with (2) imply

$$\begin{aligned}
\frac{1}{T} \int_0^T \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau + iv \right) \right| \, d\tau & \leq \left(\frac{1}{T} \int_0^T \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau + iv \right) \right|^2 \, d\tau \right)^{1/2} \\
& = \left(\frac{1}{T} \int_v^{T+v} \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau \right) \right|^2 \, d\tau \right)^{1/2} \\
& \leq \left(\frac{2}{T} \int_0^{T+|v|} \left| \mathcal{Z} \left(\frac{1}{2} + \varepsilon + i\tau \right) \right|^2 \, d\tau \right)^{1/2} \\
& \ll_{\varepsilon} \left(\frac{1}{T} (T + |v|)^{2-2(1/2+\varepsilon)+\varepsilon_1} \right)^{1/2} \\
& \ll_{\varepsilon} T^{-\varepsilon+\varepsilon_1/2} + \frac{1}{\sqrt{T}} |v|^{1/2-\varepsilon+\varepsilon_1/2} \\
& \ll_{\varepsilon} T^{-\varepsilon/2} + \frac{|v|^{1/2}}{\sqrt{T}}.
\end{aligned}$$

Hence,

$$I_1 \ll_{\sigma_0, K, \varepsilon} y^{-\varepsilon} \int_{-\infty}^{+\infty} e^{c_1|v|} \left(T^{-\varepsilon/2} + \frac{|v|^{1/2}}{\sqrt{T}} \right) dv \ll_{\sigma_0, K, \varepsilon} y^{-\varepsilon} (T^{-\varepsilon/2} + T^{-1/2}) \\ \ll_{\sigma_0, K, \varepsilon} y^{-\varepsilon} T^{-\varepsilon/2}.$$

Passing to the estimate of I_2 , and setting $g(z) = l_y(z)/z$, we obtain

$$g'(z) = \frac{y^z}{\sigma_0} \Gamma\left(\frac{z}{\sigma_0}\right) \left(\frac{1}{\sigma_0} \psi\left(\frac{z}{\sigma_0}\right) + \log y \right)$$

where $\psi(x) = \Gamma'(x)/\Gamma(x)$ denotes the digamma-function. Hence,

$$R_y(s) = g'(1-s) + (2\gamma_0 - \log 2\pi)g(1-s) \\ = \frac{y^{1-s}}{\sigma_0} \Gamma\left(\frac{1-s}{\sigma_0}\right) \left(\frac{1}{\sigma_0} \psi\left(\frac{1-s}{\sigma_0}\right) + \log y + 2\gamma_0 - \log 2\pi \right).$$

Thus, we find

$$R_y(s+i\tau) \ll y^{1-\sigma} \left| \Gamma\left(\frac{1-\sigma}{\sigma_0} + i\frac{t+\tau}{\sigma_0}\right) \right| \left(\left| \psi\left(\frac{1-\sigma}{\sigma_0} + i\frac{t+\tau}{\sigma_0}\right) \right| + \log y + 1 \right) \\ \ll_{\sigma_0} y^{1-\sigma} \exp\left\{ -\frac{c}{\sigma_0} |t+\tau| \right\} \left(\log \left| \frac{t+\tau}{\sigma_0} \right| + \log y + 1 \right)$$

and therefore

$$\sup_{s \in K} |R_y(s+i\tau)| \ll_{\sigma_0, K} y^{1-(1/2+2\varepsilon)} \exp\left\{ -\frac{c}{\sigma_0} \tau \right\} (\log(\tau+2) + \log y) \\ \ll_{\sigma_0, K, \varepsilon} y^{1/2-\varepsilon} \exp\{-c_2|\tau|\}.$$

Thus, we obtain

$$I_2 = \frac{1}{T} \int_0^T \sup_{s \in K} |R_y(s+i\tau)| d\tau \ll_{\sigma_0, K, \varepsilon} \frac{y^{1/2-\varepsilon}}{T} \int_0^T \exp\{-c_2\tau\} d\tau \ll_{\sigma_0, K, \varepsilon} \frac{y^{1/2-\varepsilon}}{T}.$$

Consequently,

$$\frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s+i\tau) - \mathcal{Z}(s+i\tau)| d\tau = I_1 + I_2 \ll_{\sigma_0, K, \varepsilon} y^{-\varepsilon} T^{-\varepsilon/2} + \frac{y^{1/2-\varepsilon}}{T}.$$

Tending $T \rightarrow \infty$, we find

$$\lim_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s+i\tau) - \mathcal{Z}(s+i\tau)| d\tau = 0.$$

Then, the desired assertion follows. $\square$

6. Proof of Theorem 2

We return to the limit measure P_y in Lemma 6. We recall that $P_{T,y} \xrightarrow[T \rightarrow \infty]{W} P_y$.

Lemma 9. *The family of probability measures $\{P_y : y > 1\}$ is tight.*

Proof. Let $K \subset D$ be a compact set. Then, we have

$$\begin{aligned} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s + i\tau)| d\tau &\leq \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}(s + i\tau) - \mathcal{Z}_y(s + i\tau)| dt \\ &\quad + \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}(s + i\tau)| d\tau. \end{aligned} \quad (23)$$

Let L be a simple closed contour lying in D , enclosing a compact K and such that

$$\inf_{z \in L} \inf_{s \in K} |z - s| \geq c(L) > 0.$$

Then, the application of the integral Cauchy formula gives

$$|\mathcal{Z}(s + i\tau)| \leq \frac{1}{2\pi} \int_L \frac{|\mathcal{Z}(z + i\tau)|}{|z - s|} |dz|,$$

and

$$\sup_{s \in K} |\mathcal{Z}(s + i\tau)| \leq \frac{1}{2\pi c} \int_L |\mathcal{Z}(z + i\tau)| |dz| \ll_L \int_L |\mathcal{Z}(z + i\tau)| |dz|.$$

Setting $z = \sigma + it$ for $z \in L$, and using the inequality (2), we find

$$\begin{aligned} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}(s + i\tau)| d\tau &\ll_L \int_L \frac{1}{T} \int_0^T |\mathcal{Z}(z + i\tau)| d\tau |dz| \\ &\ll_L \int_L \left(\frac{1}{T} \int_0^T |\mathcal{Z}(z + i\tau)|^2 d\tau \right)^{1/2} |dz| \\ &\ll_L \int_L \left(\frac{1}{T} \int_0^{T+|t|+1} |\mathcal{Z}(\sigma + i\tau)|^2 d\tau \right)^{1/2} |dz| \\ &\ll_L \int_L \left(\frac{1}{T} (T + |t|)^{2-2\sigma+\varepsilon_1} \right)^{1/2} |dz| \ll_L T^{-\varepsilon/2}. \end{aligned}$$

Thus,

$$\limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}(s + i\tau)| dt \leq C < \infty.$$

Therefore, by (23) and Lemma 8,

$$\sup_{y \geq 1} \limsup_{T \rightarrow \infty} \frac{1}{T} \int_0^T \sup_{s \in K} |\mathcal{Z}_y(s + i\tau)| dt \leq R < \infty.$$

Fix $\varepsilon > 0$ and put $M_l = R2^l \varepsilon^{-1}$, $l \in \mathbb{N}$. Let $Y_y(s)$ be a $H(D)$ -valued random element with the distribution P_y . Then,

$$\mathbb{P} \left(\sup_{s \in K_l} |Y_y(s)| > M_l \right) \leq \sup_{y \geq 1} \limsup_{T \rightarrow \infty} \frac{1}{TM_l} \int_0^T \sup_{s \in K_l} |\mathcal{Z}_y(s + i\tau)| d\tau \leq \frac{\varepsilon}{2^l}.$$

Hence, we have

$$\mathbb{P}(Y_y(s) \in K) \geq 1 - \varepsilon$$

for all $y \geq 1$, where

$$K = \left\{ g \in H(D) : \sup_{s \in K_l} |g(s)| \leq M_l, l \in \mathbb{N} \right\},$$

and the lemma is proved. $\square$

Proof of Theorem 2. By Lemma 9 and the Prokhorov theorem, the family $\{P_y : y \geq 1\}$ is relatively compact. Therefore, there exists a sequence $\{y_k\}$, $y_k \rightarrow \infty$ as $k \rightarrow \infty$ such that $\{P_{y_k}\}$ converges weakly to a certain probability measure P on $(H(D), \mathcal{B}(H(D)))$ as $k \rightarrow \infty$. Since the distribution of Y_{y_k} is P_{y_k} , we have

$$Y_{y_k} \xrightarrow[k \rightarrow \infty]{\mathcal{D}} P. \quad (24)$$

Define

$$Z_T(s) = \mathcal{Z}(s + i\theta_T).$$

Then, in view of Lemma 8, for every $\varepsilon > 0$,

$$\begin{aligned} & \lim_{y \rightarrow \infty} \limsup_{T \rightarrow \infty} \mathbb{P}(\rho(Z(s), Y_{T,Y}(s)) \geq \varepsilon) \\ & \leq \lim_{y \rightarrow \infty} \limsup_{T \rightarrow \infty} \frac{1}{T\varepsilon} \int_0^T \rho(\mathcal{Z}(s + i\tau), \mathcal{Z}_y(s + i\tau)) d\tau = 0. \end{aligned}$$

The latter equality, relations (15) and (24) show that all hypotheses of Lemma 4 are satisfied. Therefore, we obtain the relation

$$Z_T \xrightarrow[T \rightarrow \infty]{\mathcal{D}} P,$$

and this is equivalent to the assertion of the theorem. $\square$

7. Proof of Theorem 1

We derive Theorem 1 from Theorem 2 by applying properties of weak convergence of probability measures. We will approximate functions from the support of the limit measure P of P_T in Theorem 2. The application of Theorem 2 is based on the following equivalents of weak convergence, see, for example, [18].

Lemma 10. Let P_n , $n \in \mathbb{N}$, and P be probability measures on $(\mathcal{X}, \mathcal{B}(\mathcal{X}))$. Then, the following statements are equivalent.

$$1^\circ \quad P_n \xrightarrow[n \rightarrow \infty]{W} P.$$

2° For every open set $G \subset \mathcal{X}$,

$$\liminf_{n \rightarrow \infty} P_n(G) \geq P(G).$$

3° For every continuity set A of the measure P (A is a continuity set of P if $P(\partial A) = 0$, where ∂A is a boundary of A),

$$\lim_{n \rightarrow \infty} P_n(A) = P(A).$$

Proof of Theorem 1. Denote by F the support of the limit measure P in Theorem 2. The set F is a minimal closed subset of $H(D)$ such that $P(F) = 1$. The set F consists of all elements $f \in H(D)$ such that, for every open neighborhood G of f , the inequality $P(G) > 0$ is satisfied. Obviously, $F \neq \emptyset$.

For $f \in F$, define

$$G_\varepsilon = \left\{ g \in H(D) : \sup_{s \in K} |g(s) - f(s)| < \varepsilon \right\}.$$

Then, G_ε is an open neighborhood of the element f of the support of P . Therefore,

$$P(G_\varepsilon) > 0. \quad (25)$$

Thus, by Theorem 2, and 1° and 2° of Lemma 10,

$$\liminf_{T \rightarrow \infty} \frac{1}{T} \mu \left\{ \tau \in [0, T] : \sup_{s \in K} |\mathcal{Z}(s + i\tau) - f(s)| < \varepsilon \right\} \geq P(G_\varepsilon) > 0.$$

To prove the second assertion of the theorem, we notice that the boundary ∂G_ε lies in

$$\left\{ g \in H(D) : \sup_{s \in K} |g(s) - f(s)| = \varepsilon \right\}.$$

Hence, $\partial G_{\varepsilon_1} \cap \partial G_{\varepsilon_2} = \emptyset$ for $\varepsilon_1 \neq \varepsilon_2$. Thus, $P(\partial G_\varepsilon)$ can be positive for at most countably many positive ε , in other words, G_ε is a continuity set of P , except for all but at most a countable set of values $\varepsilon > 0$. Therefore, Theorem 2, 1° and 3° of Lemma 10, and (25) show that the limit

$$\lim_{T \rightarrow \infty} \frac{1}{T} \mu \left\{ \tau \in [0, T] : \sup_{s \in K} |\mathcal{Z}(s + i\tau) - f(s)| < \varepsilon \right\} = P(G_\varepsilon) > 0.$$

exists for all but at most countably many $\varepsilon > 0$. The theorem is proved. $\square$

8. Conclusions

In this paper, we found that the shifts of the Mellin transform of the square of the Riemann zeta-function $\zeta(s)$

$$\mathcal{Z}(s) = \int_1^\infty \left| \zeta\left(\frac{1}{2} + ix\right) \right|^2 x^{-s} dx$$

approximate a certain class F of analytic functions defined in the strip $\{s \in \mathbb{C} : 1/2 < \sigma < 1\}$. The main ingredient of the proof of the above result is a limit theorem for the function $\mathcal{Z}(s)$ in the space of analytic functions. Note that a problem of approximation of analytic functions by shifts of the function $\mathcal{Z}(s)$ is new, and it is discussed for the first time. The main result and method are inspired by universality theorems for $\zeta(s)$. Unfortunately, the set F is not explicitly given. This is a complicated future problem. Additionally, we are planning to extend the results of the paper for Mellin transforms of other powers of $\zeta(s)$.
