

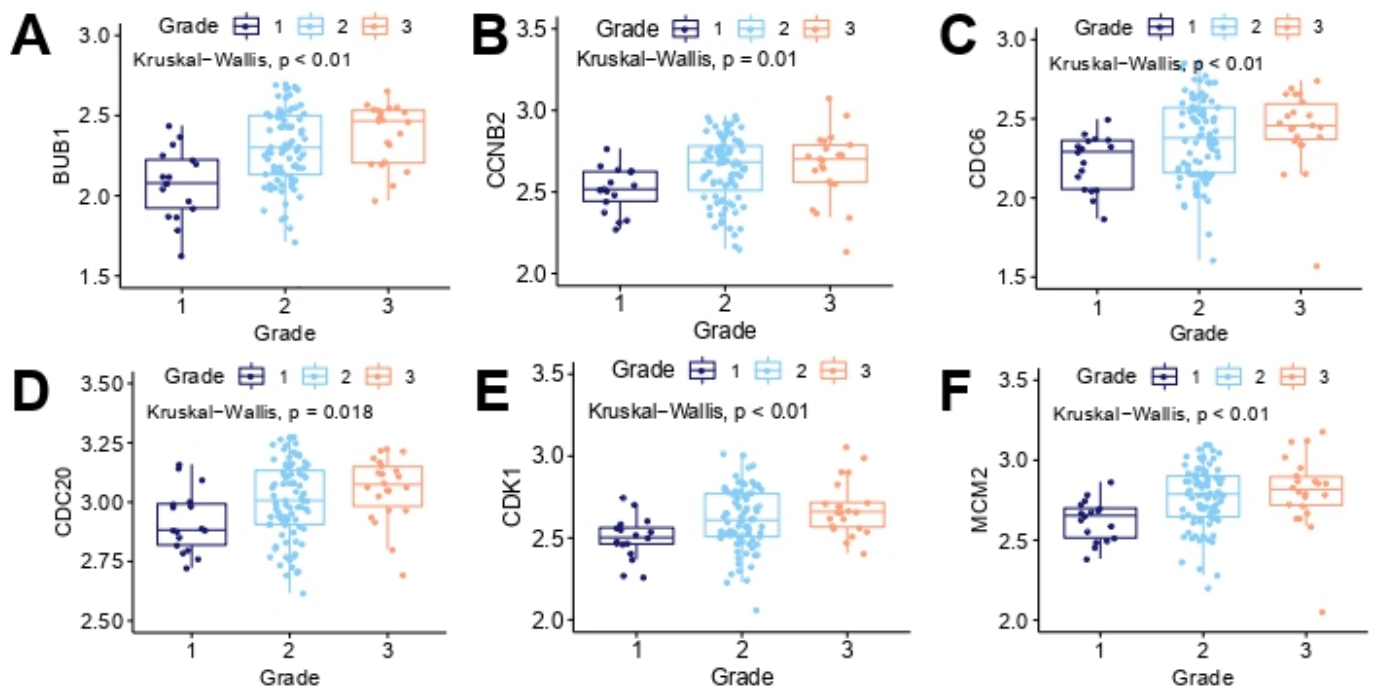

Figure S1. Expression pattern of hub genes in different tumor grades from TCGA-TSCC patients. (a–f) The results revealed that six hub proteins (BUB1, CCNB2, CDC6, CDC20, CDK1, and MCM2) were positively correlated with tumor grades ($P < 0.05$).

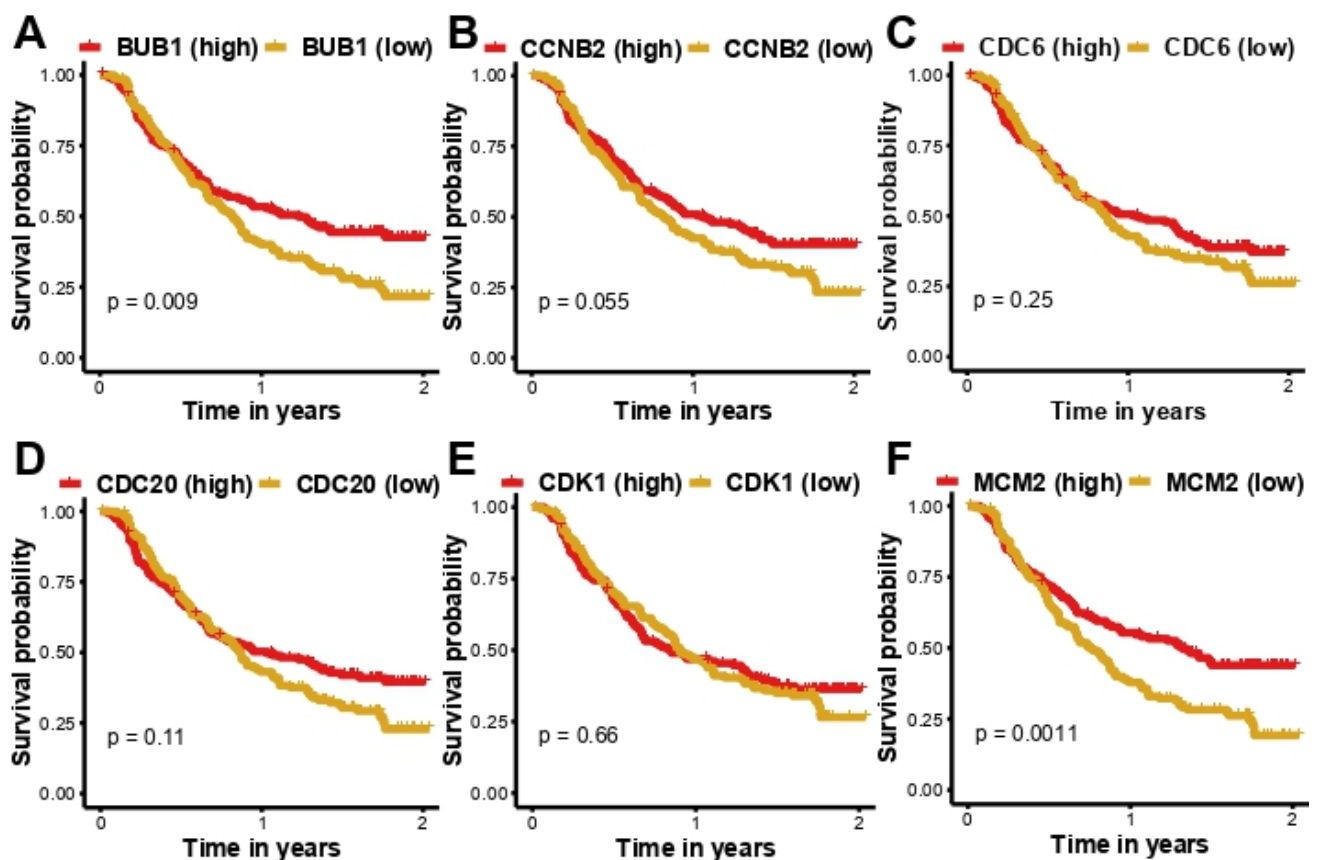

Figure 2. Survival analysis of the association between the expression of hub genes and overall survival time in the validation dataset (Imvigor210). (a–f) The Kaplan-Meier survival curve revealed that high BUB1 and MCM2 expression conferred better overall survival in patients with TSCC ($P < 0.05$).
