

Supplementary Figure S1. Change in body weight over treatment time. Mice were maintained on food pellets supplemented with 1.5% (w/w) tBHQ or vehicle for 20 days. Weight of animals is expressed as percentage of original body weight measured at the first day of the treatment period. Data are means \pm SD of 6-6 mice/group

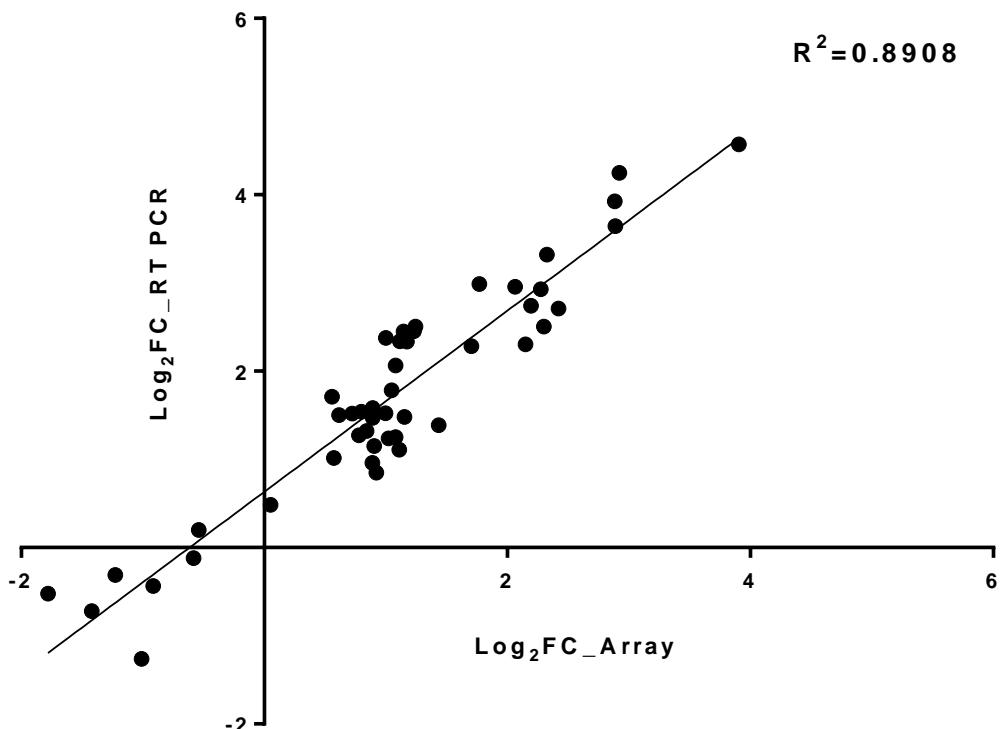

Supplementary Figure S2. Representative scatter plot of CD3⁺ positivity of CD4⁺ cells.

CD4⁺ cells were isolated from splenocytes derived from tBHQ fed and control mice with magnetic separation. CD3 positivity of these cells were determinated with FACS analysis.

Supplementary Figure S3. Correlation between cDNA microarray and RT-PCR data.

The fold changes in transcript levels of 47 selected genes determined by both methods were log₂ transformed, and the values were plotted against each other to evaluate their correlation.

Supplementary Table S1. List of significantly changed genes after per os tBHQ treatment measured with Agilent microarray. In total 269 genes were found with a significantly changed expression in tBHQ treated, splenic CD4⁺ cells compared to control (_{nom}p<0.05). From these, altogether 47 genes were validated back by RT-PCR (marked with bold asterisk [*])

Up-regulated genes			Down-regulated genes

Supplementary Figure S4. Network analysis of significantly enriched gene sets after *per os* tBHQ treatment in splenic CD4⁺ lymphocytes. The network contains 56 nodes. Nodes represent GO pathways significantly changed in gene set enrichment analysis ($p<0.05$, false discovery rate <0.25). Green nodes represent GO terms, grey edges connection between them. The size of the nodes is proportional with the number of genes in the GO term and the thickness of grey edges represents the number of common genes between two GO terms (FDR=0.25, $p<0.05$, edge cutoff 0.5).

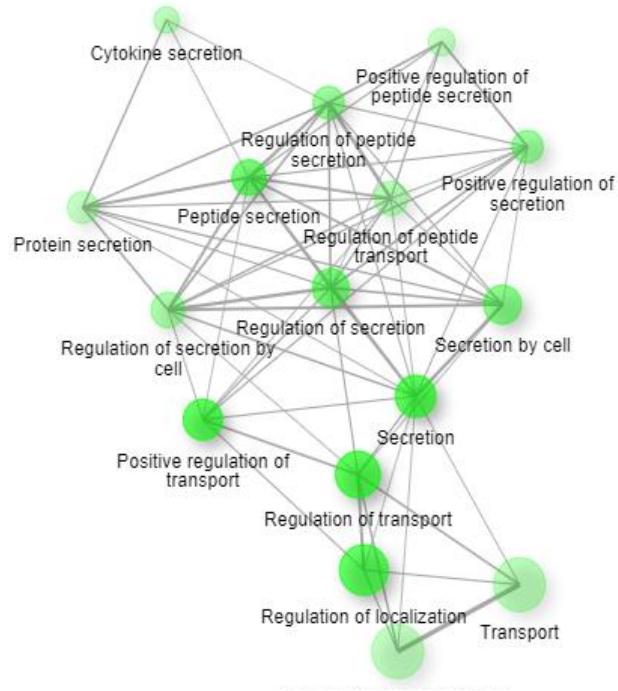

Supplementary Figure S5. Additional subnetworks from Network analysis. Nodes represent GO pathways significantly changed in gene set enrichment analysis ($p<0.05$, false discovery rate <0.25). Green nodes represent GO terms, grey edges connection between them. The size of the nodes is proportional with the number of genes in the GO term and the thickness of grey edges represents the number of common genes between two GO terms (FDR=0.25, $p<0.05$, edge cutoff 0.5).

A. Regulation of cell signaling

B. Secretion and transport

Supplementary Table S2. Significantly changed GO, KEGG, Reactome, TF, WP and CORUM terms after g:Profiler analysis [64]. Input genes were from Table 1 (significantly changed after tBHQ treatment and those that are related to influenza or SARS-CoV-2). A.) Influenza, B.) SARS-CoV-2.

A. Influenza

Supplementary Table S3. Putative AHR and NRF2 binding sites on the genes listed in Table 1. After analyses with GeneHancer, those genes were selected from the list, that had ‘elite’ enhancer–gene relations reflecting both a high-likelihood enhancer definition and a strong enhancer–gene association. A Influenza, B SARS-CoV2

A. Influenza
