

SUPPLEMENTARY TABLE 1. The diagnostic performances of SARC-F, using cut-off value of ≥ 4 .

	Sen (%)	Spe (%)	PPV (%)	NPV (%)
Low skeletal muscle index ^a	11.1	91.2	11.1	91.2
Handgrip strength weakness ^b	17.1	96.6	77.8	62.6
Slow gait speed ^c	19.5	98.3	88.9	63.7
Poor sit-to-stand test $\geq 12\text{s}^{\text{d}}$	16.4	100.0	100.0	49.5
Possible sarcopenia ^e	13.9	100.0	100.0	38.5
Sarcopenia ^f	14.3	91.4	11.1	93.4

^a Skeletal muscle index below the sex-specific 10th percentile of reference population

^b Maximum handgrip strength of both hands <28 kg in male and < 18 kg in female

^c 6-meter gait speed <1.0 m/s

^d Repeated sit-to-stand test $\geq 12\text{s}$

^e The presence of either handgrip strength weakness or sit-to-stand test $\geq 12\text{s}$

^f The presence of low skeletal muscle index with either handgrip strength weakness, slow gait speed, or poor sit-to-stand test

Sen, sensitivity; Spe, specificity; PPV, positive predictive value; NPV, negative predictive value.

SUPPLEMENTARY TABLE 2. Predictive validity of SARC-F score on 24-month mortality, using different cut-off values.

Cut-off values	Sen (%)	Spe (%)	PPV (%)	NPV (%)
≥ 1 [†]	85.0	47.2	21.8	94.8
≥ 2	67.5	63.2	24.1	91.8
≥ 3	57.5	73.2	27.1	90.9
≥ 4	52.5	77.5	28.8	90.4
≥ 5	40.0	85.3	32.0	89.1
≥ 6	40.0	87.0	34.8	89.3
≥ 7	27.5	92.6	39.3	88.1
≥ 8	17.5	94.8	36.8	86.9
≥ 9	5.0	98.7	40.0	85.7

[†]Best cut-off

Sen, sensitivity; Spe, specificity; PPV, positive predictive value; NPV, negative predictive value.
