Supplementary Table 2 Determination of the relative expression of cytokines using $2^{-\Delta\Delta Ct}$ method. Absolute value from real-time PCR of both TB antigen-stimulated and unstimulated samples with specific markers and the endogenous gene entered an excel sheet. The change in between the control and stimulated was calculated by normalizing with GAPDH, (E and F). $\Delta\Delta Ct$ (G) denotes the differences between the antigen-stimulated and non-stimulated value of delta Ct. The relative quantification (RQ) Tb antigen-stimulated (J) was finally calculated by $2^{-\Delta\Delta Ct}$.

GAPDH Ct value		Gene X CT value		Marker X delta Ct		Marker X $\Delta\Delta Ct$		Marker-X RQ Ct	
Nil	TB Ag	Nil	TB-Ag	Nil	TB-Ag	Nil	TB-Ag	Nil	TB-Ag

A	B	C	D	E=C-A	F=D-B	G=E-E	H=F-E	I=2 ^G	J=2 ^{-H}

Supplementary Table 3 Normality test of relative gene expression of cytokines. The test of normality with sig. a value less than 0.05 implies that the data deviate from normal distribution. Thus, the nonparametric criteria were applied for data analysis using ANOVA and t-test.

Supplementary Table 5 Decision tree (DT) analysis of combined cytokines gene expression using R program that run with 4000 iterations. The expression of healthy controls plus latently infected individuals was compared with actively infected participants (both pulmonary and extrapulmonary tuberculosis), pulmonary tuberculosis and extrapulmonary tuberculosis, respectively. Seven selected cytokines were an input (TNF- α , CXCL9, IFN- γ , IL10, IP10, IL4 and IL2R) for the analysis.
