

Figure S1: External and internal damage criteria recorded for the different insect treatments separated by year: 'el exp' = epicarp lesions recorded immediately after insect exposure, 'el harv' = epicarp lesions recorded during harvest, 'dropped' = dropped nuts, 'kn' = kernel necrosis, 'stigma' = fungal symptoms indicating stigmatomycosis, 'aborted' = aborted nuts. Differences between years in 'dropped' and 'aborted' nuts are likely due to a change in damage evaluation. Differences between years in 'el harv' nuts are likely due to temporal differences in data recording with recording in the laboratory after a period in storage of up to four weeks in 2018 and recording in the field in 2019.
