

Figure S2. The haemocytes incubated with OPs (deriving from 2 equivalent females) at 2 h or with 1× PBS (negative control) were detached from the well transferred on slides and subjected to different staining methodologies. For H₂DCFDA staining, after fixed on slides, cells were incubated in the dark with H₂DCFDA 10 μ M for 30 min at room temperature. After three times washing in 1× PBS, the slides were mounted with Fluoroshield with DAPI, histology mounting medium (Sigma-Aldrich St Louis, MO, USA, catalogue number F6057).
