## Supplementary File S1

Linear predictors of the Generalized Linear Models fitted to the data of the different response variables of Experiment 1 (See the Materials and Methods and Results section of the main text for details). We present the output from the analyses computed in the R software (R Development Core Team 2017).

**Pupation** (YBIN = a binary vector with data of larvae that pupated and larvae that do not pupated)

Call:

```
glm(formula = YBIN ~ SubstrateType + SubstrateVolumemL, family = quasibinomial)

## Supplementary File S2

This Supplementary File S2 presents the multiple comparisons of means performed after ANOVA tests detected significant effects of the predictor variable (i.e., substrate type) in the response variables (i.e., pupation, female emergence and female fliers) (See the Materials and Methods and Results section of the main text for details). We present the output of the Tukey contrasts computed in the R software (R Development Core Team 2017) using the *glht* function of the package *multcomp* (Hothorn et al. 2008).
