S2F. Best management practices (BMP) for native bee habitat conservation

<http://w3.biosci.utexas.edu/jha/wp-content/uploads//Native-Pollinator-Habitat.jpg>

S2G. Pollinator Habitat Conservation Guidelines (2-sided pamphlet)

Threats to Pollinators

- Habitat loss
- Pesticides
- Diseases
- Climate change

How You Can Help

Provide food & water: Bees depend on nectar and pollen. Native bees prefer native plant pollen. Provide abundant and diverse native plants from spring through fall.

Conserve nest habitat: bare ground & cavities

Prevent: soil erosion & compaction

Reduce: pesticide use

Pollinator Habitat Management

Thanks to Texas Parks and Wildlife Department initiatives, landowners may now receive tax incentives by managing pollinator habitat. TPWD outlines Pollinator Habitat Conservation practices* to help landowners qualify for agriculture-wildlife tax valuation through their county appraisal district. A landowner must implement at least three habitat management practices such as pollinator surveys. The Jha Lab can help interpret data from pollinator surveys to inform landowners of best management practices (Landowners/Naturalists webpage).

Department of Integrative Biology
College of Natural Sciences

Plants & Native Bees

~87% of flowering plants rely on animal pollinators to set fruit. There are 4,000 bee species in North America; 800+ of them in Texas alone. Native bees originated in and are adapted to local climate, soils, and native plants. Non-native species like the Western honeybee were introduced from Europe and became naturalized here.

Bee-pollinated Crop Species

Almonds, apples & blueberries depend on bee pollination. Watermelons, melons and squash are often pollinated by native squash bees. Peppers, tomatoes and potatoes are often buzz pollinated by native bumble bees. Leafcutter bees pollinate alfalfa more efficiently than European/Western honeybees do.

Pollination services give us 1 in 3 food morsels!

~35% of U.S. crop species rely on insect pollination. Bees boost US crop production by ~\$15 billion/year with ~\$3 billion attributed to native bees. Studies in Texas show that insect mediated cross-pollination boosts cotton yield by 17%!

Native Bee Habitat

~75% of native bees are ground-nesters: digger bees, bumble bees, and sweat bees. If soil is deeply tilled, eroded or compacted their nests are destroyed. Leave bare ground for native bee nests!

Tom Murray

~25% of native bees are cavity-nesters: carpenter bees, mason bees and leaf cutters make nests in soft wood, plant stems, rock crevices or snail shells. Nest sites are scarcer as native woodlands decrease. Leave snags, logs and thatch for nests!

Alan C. Scott Famous

~90% of native bees are solitary. A female bee lays eggs on pollen balls she makes in her nest; larvae consume this bee bread to develop into pupa and then adults.

Hundreds of butterfly and bee species inhabit Central Texas

- Sweet Bees
 - Green: *Agapostemon* (2 species)
 - Agapostemon* *metallica*
 - Striped: *Halictus* *ligatus*
 - Dark: *Lasiopterus* (6 species)
- Mining & Digger Bee
 - Andrena* *rupestris*
 - Centris* *atropis*
- Chimney Bees
 - Ancylotus* *apiformis*
 - Diadasia* (2 species)
- Plasterer Bee
 - Colletes* *texanus*
- Longhorn Bee
 - Melissodes* (4 species)
- American Bumblebees
 - Bombus* *pennsylvanicus*
- Squash Bee
 - Peponapis* *pruinosa*
- Sunflower Bee
 - Xylocopa* (3 species)
- Small Carpenter Bees
 - Cervinus* (3 species)
- Mason Bees
 - Heriades* *variabilis*
 - Osmia* *subfasciata*
- Leafcutter Bees
 - Megachile* (6 species)
- Cuckoo Bee

S2I. Tips for establishing native plant landscapes for bee food and nesting resources (1 p.)

Native Landscapes for Native Bees

Pollinator habitat should provide resources for food and nesting.

Native bees prefer native plants over non-native plants, except when invasive plants outcompete native congeners (same genus).

Bees love mints (beebalm, sage), legumes (bluebonnet, acacia), and asters (daisy, sunflower). Build on a garden scaffold made of these plants.

Group colors and aromas in large patches or strips of the same plant species.

Plant diversity sustains bee diversity. A diverse garden, blooming spring through fall, will attract many species of bees and sustain a healthy pollinator community.

Relay planting periods for staggered blooming periods throughout the season.

Mix perennial (long-lived) and annual (short-lived) plants in a pollinator garden.

Laurel Treviño, M.S., Shalene Jha, Ph.D.

Department of Integrative Biology
College of Natural Sciences

Scheme S3. Insect Labs A & B – view specimens on display with scopes & loupes

A. Distinguish Between Flower-Visiting Insects: Bees & Look-alikes

Flies: house fly, bombyliid fly (*Bombyliidae*), hoverfly (*Syrphidae*)

Wasp (Mexican honey wasp, flower wasp, paper wasp)

Hairy belly / Carder leafcutter bee (*Dianthidium* sp.)

Honey bee (*Apis mellifera*, *Apidae*)

B. Observe Native Bees in 4 of 6 North American/Texas Families

Bumble bee (*Bombus* sp., *Apidae*)

Large carpenter bee (*Xylocopa* sp., *Apidae*)

Tiny dark / Small carpenter bee (*Ceratina* sp., *Apidae*)

Hairy leg / Longhorn bee (*Melissodes* sp., *Apidae*)

Hairy leg / Sunflower / Cactus bee (*Diadasia* sp., *Apidae*)

Metallic, hairy belly / Mason (*Osmia* sp., *Megachilidae*)

Carder / leafcutter bee (*Dianthidium* sp., *Megachilidae*)

Hairy belly / Leafcutter bee (*Megachile* sp., *Megachilidae*)

Tiny dark sweat bee (*Lasioglossum* sp., *Halictidae*)

Striped sweat bee (*Halictus* sp., *Halictidae*)

Green sweat bee (*Agapostemon* sp., *Halictidae*)

Striped-abdomen, miner bee (*Perdita* sp., *Andrenidae*)

Scheme S4. Insect Labs - Example specimens of flower-visiting insects observed with scopes and loupes

FLIES (*Syrphidae* & *Bombyliidae*)

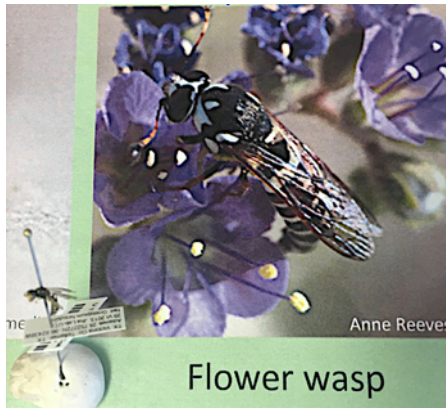

(*Syrphidae*)

(*Tachinidae* house fly)

WASPS (Flower wasp)

(Paper wasp, right)

(Mexican honey wasp)

BEES (native leafcutter)

(native green sweat bees, m. f.)

(Honey bee, *Apis mellifera*)

Schema S6A. Life history and pollination topics covered in presentations & activities

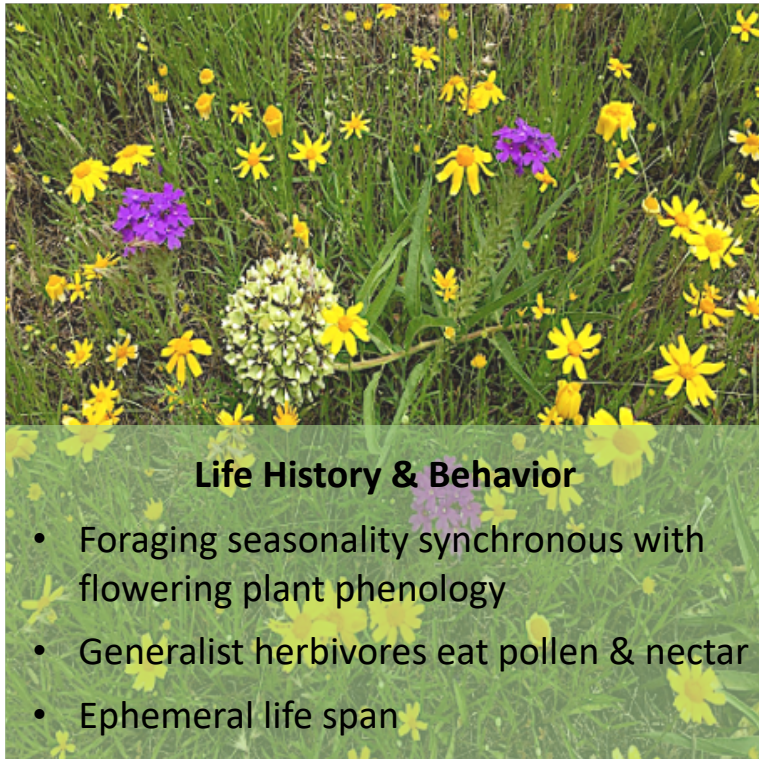

Why are Native Bees Essential to Ecosystems?
Bee life history is linked to pollination behavior

Bee life history traits are tied to pollination functions. Pollinators & flowering plants co-evolved. Bee ephemeral life spans were in synch with flowering plant phenology. Bees are pollen/nectar herbivores. Pollination adaptations include collecting & carrying pollen loads on branched hair, females provisioning nests with pollen/nectar, and floral fidelity. Pollen preferences differ among bee species; while most are *polylectic*, few are *oligolectic* or *monolectic*.

*How would you characterize native bees in Texas based on your acquired knowledge? **Most North American native bees are solitary, ground-nesting, generalists.***

S6B. Life History & Behavior

Life History & Behavior

- Foraging seasonality synchronous with flowering plant phenology
- Generalist herbivores eat pollen & nectar
- Ephemeral life span

S6C. Pollination Adaptations

Pollination Adaptation

- Branched hair carries pollen loads
- Females collect pollen for brood
- Floral fidelity / Foraging constancy

hairy-legged
sunflower bee

Diet & Behavior

- Floral fidelity facilitates pollination
- Pollen preference
polylectic ~ generalist, oligolectic ~ specialist

S6D. Nesting Behavior & Sociality

Nesting Behavior - Sociality

Females make & provision nest with pollen/nectar

Nesting substrates - Ground (~75% spp) Cavity (~25% spp)

Sociality Gradient - 90% solitary, 10% communal or social

Leafcutter (*Megachile*, *Megachilidae*)

Agapostemon Laura Russo, Cornell

Carpenter (*Xylocopa*, *Apidae*)

Scheme S7. Test questions #1-5 were projected on a screen for students' visual ID of flower-visiting insects

1. Fly & Bee

A Which is the fly? B

4

2. Wasp & Bee

A Which is the wasp? B

5

3. Bee & Flies. Which is the bee?

A B

C D

6

4. Which is the Honey Bee?

A B

C D

7

5. What sex is this bee?
Megachile sp. leafcutter

8

1. A. syrphid/hover fly
B. *Dianthidium curvatum* (Megachilidae) bee
resin mason leafcutter

2. A. *Anthidium florentinum* (Megachilidae) bee
B. wasp

3. A. Tachinidae flesh fly
B. Bombyliidae fly
C. *Dianthidium curvatum* (Megachilidae)
D. Tabanidae horse fly

4. A. *Apis mellifera* (Apidae) Western honey bee
B, C. *Megachile fortis* (Megachilidae) male
C. *Megachile* leafcutter bee (female); 5. *idem*

Note: Answer key (bottom right) for reference was not shown to students during tests in class

Scheme S8. Test questions #6-10 refer to topics on bee ecology content knowledge

“Native Bees of Texas” Course Quiz Answer Key Your Bee Name (2018) _____

Questions 1-5 refer to 5 slides of insects projected on the screen (previous page).

1. Fly & bee. Which is the fly? A, B
2. Wasp & bee. Which is the wasp? A, B
3. Bee & flies. Which is the bee? A, B, C, D
4. Four Bees. Which is the honey bee? A, B, C, D
5. What sex is this native leafcutter bee? A) male, B) female
6. Where do most native bee species nest (substrate in North America)?
A) cavities, B) ground, C) trees, D) all of these, E) I don't know
7. What features can help distinguish a bee from a fly or wasp in a garden?
A) 4 wings, B) fuzzy (branched) hair, C) flower constancy, D) all of these, E) I don't know
8. Why are bees important for ecosystem functions? Because they...
A) are food for wildlife, B) pollinate most plants, C) help produce fruits & seeds, D) all, E) I don't know
9. What pollination services do bees provide for us?
A) improve fruit quality, B) boost fruit yield, C) pollinate most of our fruits, D) all, E) I don't know
10. Why are native bee populations declining?
A) they aren't multiplying, B) habitat loss, C) they reached carrying capacity, D) all, E) I don't know

What occupation or hobby best describes you? Please, circle or state (include retired/current).

Photo Carlos Torres Verdin

**Scheme S9. Feedback Form: Overall & specific knowledge and open-ended feedback (top) 2018 & 2019
Participant retrospective self-rating of perceived knowledge gains (bottom) – 2019 only**

Feedback Form - Native Bees of Texas Course

On a scale of 1-5, please rate this class based on the following criteria:

How informative it was / How useful the knowledge or skills will be / How engaged were you as a participant?

Not informative	1	2	3	4	5	Informative
Not useful	1	2	3	4	5	Useful
Not engaged	1	2	3	4	5	Engaged

As a result of today's workshop, I am better able to ...

Understand the importance of native bees in ecosystems and agroecosystems

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Distinguish native bees from other flower visiting insects that look like them

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Identify common native bees of Central Texas with the help of the basic guides we used in this class

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Use this foundation of bee family taxonomy to learn more about the huge diversity of native bees on my own

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Use best management practices to conserve native bee habitat (based on nest habits, life cycles, plants)

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Choose the best combinations of native prairie plants to make a native bee garden in Central Texas

Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	2	3	4	5

Describe how you intend to use skills/knowledge that you learned in today's sessions in your practice/home

The best part(s) of this event was/were _____

This event could be improved by _____
