

Supplementary material

**Exploring the diversity of plant-associated viruses and related viruses in
riverine freshwater samples collected in Berlin, Germany**

Roland Zell¹, Marco Groth², Lukas Selinka¹, Hans-Christoph Selinka³

Legends to Supplementary Figures:

Supplementary Figure S1: Phylogenetic analysis of tombus-like viruses. The dataset includes 518 RdRp sequences and is comprised of 282 Teltow Canal tombus-like viruses (TC-Tombus-LV, printed in red), 75 Havel River tombus-like viruses (H-Tombus-LV, printed in red), 99 unclassified tombus-like viruses downloaded from GenBank (printed in blue), 57 reference viruses of the *Tolivirales* and 5 reference viruses of the *Nodamuvirales* (printed in black). Amino acid sequences were aligned with MEGA and used for tree inference with IQTREE 2 (optimal substitution model: VT+F+R10; 10,000 ultrafast replications). The tree was arbitrarily rooted with nodaviruses. The scale bar indicates substitutions per site. Presented are GenBank accession numbers, virus names, and – if available – genus names, (sub-)family names, order names. Yellow and ochre boxes identify viruses which use translation table 6 and express a viral methyltransferase, respectively. Numbers at nodes indicate ultrafast bootstrap support greater 75%.

Supplementary Figure S2: Phylogenetic analysis of capsid proteins with similarity to peptidase A

21. CP sequences of 11 reference viruses of the *Alphatetraviridae*, *Carmotetraviridae*, and *Permutotetraviridae* families (printed in black) were aligned with CP sequences of this study (printed in red) and unclassified viruses retrieved from GenBank (printed in blue). Amino acid sequences were aligned with MEGA and used for tree inference with IQTREE 2 (optimal substitution model: Q-pfam+F+G4; 1000 replications). Numbers at nodes indicate bootstrap support. The scale bar indicates substitutions per site. Presented are GenBank accession numbers, family names (in bold letters), genus names, virus names and strain designations if two or three viruses of a species were included in the alignment.

Supplementary Figure S3: Phylogenetic analysis of 165 capsid protein sequences. The alignment included 54 amino acid sequences of Teltow Canal tombus-like viruses (TC-Tombus-LV, printed in red), 27 sequences of Havel tombus-like viruses (H-Tombus-LV, printed in red), 68 reference viruses of the *Tombusviridae* and *Solemoviridae* (printed in black) and 16 sequences of unclassified viruses (printed in blue). IQTREE2 was used for tree inference (optimal substitution model: Q.pfam+F+R5; 1000 bootstrap replications). The tree was arbitrarily rooted with sequences of the pfam00894 cluster. The scale bar indicates substitutions per site. Presented are GenBank accession numbers, virus names, and – if available – genus names and family names. Numbers at nodes indicate bootstrap support greater 50%. Square brackets indicate the protein family (pfam) annotation. Yellow boxes highlight viruses which use translation table 6. Numbers at nodes indicate ultrafast bootstrap support greater 75%.

Supplementary Figure S4: Phylogenetic analysis of solemo-like viruses. The dataset includes 144 RdRp sequences and is comprised of 48 Teltow Canal solemo-like viruses (TC-solemo-LV, printed in red), 24 Havel River solemo-like viruses (H-Solemo-LV, printed in red), 28 unclassified viruses downloaded from GenBank (printed in blue), 35 reference viruses of the *Solemoviridae* (printed in black), 5 reference viruses of the *Tombusviridae* (printed in black), 2 reference viruses of the *Alvernaviridae* (printed in black), and 1 reference virus of the *Barnaviridae* (printed in black). Amino acid sequences were aligned with MEGA and used for tree inference with IQTREE 2 (optimal substitution model: VT+F+R9; 10,000 ultrafast replications). The tree was arbitrarily rooted with tombusviruses. The scale bar indicates substitutions per site. Presented are GenBank accession numbers, virus names, and – if available – genus names, family names, order names. Yellow boxes highlight viruses of solemo-like clade A. The strong yellow box marks viruses with presumed proteinase activity of their capsid protein, the light yellow box distinguishes viruses with similarity to

peptidase A6 but lacking proteinase activity. Brown boxes highlight viruses with barna-like RdRp (cd23184), i.e., barnavirus, Tk-Solemo-LV-63, and solemo-like clades B and C. Numbers at nodes indicate ultrafast bootstrap support greater 75%.

Supplementary Figure S5: Phylogenetic analysis of solemo-like clade A capsid proteins. CP sequences of 10 solemo-like clade A viruses (printed in red) were aligned with CP sequences of five alphanodaviruses (printed in black). The yellow box indicates three viruses with presumed peptidase A6 activity as judged from the presence of the active site aspartic acid (D₈₆ according to flock house virus numbering) and the cleavage site at asparagine 363 (according to flock house virus numbering). Tree inference was conducted with IQTREE2 (substitution model: Q.pfam+F+I+G4, 1000 replications). The tree was arbitrarily rooted with nodaviruses. Numbers at nodes indicate bootstrap support greater 50%. Abbreviations: H-Solemo-LV, Havel River solemo-like virus; TC-Solemo-LV, Teltow Canal solemo-like virus.

Supplementary Figure S6: Phylogenetic analysis of partiti-like viruses. (A) RdRp analysis. The dataset includes 90 RdRp sequences comprised of 12 partiti-like viruses of Teltow Canal, 38 reference viruses of the *Partitiviridae*, and 40 sequences of unclassified partiti-like viruses downloaded from GenBank. Amino acid sequences were aligned with MEGA and used for tree inference with IQTREE 2 (optimal substitution model: VT+F+R6; 1000 replications). The tree was arbitrarily rooted with betapartitiviruses. Square brackets indicate the members of the five partitivirus genera. **(B) - (D) Capsid protein analysis.** CP sequences of 18 betapartitivirus reference strains, 4 unclassified viruses and Havel partiti-like virus 1 **(B)**, 9 gammapartitiviruses, 4 unclassified viruses and Teltow Canal partiti-like virus 4 **(C)**, and 5 deltapartitiviruses, 5 unclassified viruses and Teltow Canal partiti-like virus 6 **(D)** were aligned with MEGA and used for tree inference with IQTREE2 (optimal substitution models: Q.pfam+F+R4 in **(B)**, LG+F+G4 **(C)**, Q.pfam+F+G4 **(D)**; 1000 replications). Presented are unrooted trees.

Numbers at nodes indicate bootstrap support greater 50%. The scale bar indicates substitutions per site. Color code: red, partiti-like viruses from Teltow Canal and Havel River; black, reference viruses; blue, unclassified viruses from GenBank.

Supplementary Figure S7: Phylogenetic analysis of alphaflexi-like viruses. RdRp **(A)** and helicase sequences **(B)** of Teltow Canal pepino mosaic viruses (printed in red) and 34 reference viruses (*Alphaflexiviridae*, *Betaflexiviridae*, *Deltaflexiviridae*, *Gammaflexiviridae*, and *Tymoviridae*; printed in black) were aligned with MEGA and used for tree inference with IQTREE2 (optimal substitution model: Q.pfam+F+I+G4 **(A)**, Q.pfam+I+G4 **(B)**; 1000 replications). The tree was arbitrarily rooted with the deltaflexiviruses. Presented are GenBank acc. nos., virus names and genus designations. Square brackets indicate families. Numbers at nodes indicate bootstrap support greater 50%. The scale bar indicates substitutions per site.

Supplementary Figure S8: Genome layouts. The genomes of *Procedovirinae/Tombusviridae* **(A)**, *Regressovirinae/Tombusviridae* **(B)**, and viruses of tombus-like clade A **(C)**, tombus-like viruses with methyltransferase **(D)**, and solemo-like clades A, B and C **(E)** of Teltow Canal and Havel River are presented with the aid of selected sequences. In **(A)**, **(B)** and **(E)**, the genome organization of reference viruses is included. Thick lines represent the genomes with boxes indicating open reading frames. The lengths of genomes are given. Short arrows and vertical lines indicate the position of readthrough termination codons of *Procedovirinae* members. -1FS and vertical lines indicate the position of -1-frameshift signals of *Regressovirinae* members. Abbreviations: CP, capsid protein; MP, movement protein; ORF, open reading frame; pept, peptidase; PLA2, phospholipase A2; RdRp, RNA-dependent RNA polymerase; Trp2, trypsin-like peptidase family 2; VMeTr, viral methyltransferase.
